

Technical Specification for the Preparatory Phase (Part I)

This document contains part I of the technical specifications for the preparatory phase. It needs to be applied in combination with part II of the technical specifications.

A number of simplifications and technical assumptions contained in this document have been made for pragmatic reasons and for the purpose of the preparatory phase only. The technical specifications therefore should not be seen as a complete implementation of the Solvency II framework.

This technical specifications have been drafted to reflect the content of the Directive 138/2009/EC and any amendments already agreed to it by the Omnibus II Directive, the content of working documents of the (Level 2) Delegated Acts, and where relevant and necessary, the working document of the (Level 3) Guidelines for the purpose of clarity.

SECTION 1 – VALUATION

V.1. Assets and Other Liabilities

V.1.1. Valuation approach

V.1. The primary objective for valuation as set out in Article 75 of Directive 2009/138/EC requires an economic, market-consistent approach to the valuation of assets and liabilities. According to the risk-based approach of Solvency II, when valuing balance sheet items on an economic basis, undertakings need to consider the risks that arise from a particular balance sheet item, using assumptions that market participants would use in valuing the asset or the liability.

V.2. According to this approach, insurance and reinsurance undertakings value assets and liabilities as follows:

- i. Assets should be valued at the amount for which they could be exchanged between knowledgeable willing parties in an arm's length transaction;
- ii. Liabilities should be valued at the amount for which they could be transferred, or settled, between knowledgeable willing parties in an arm's length transaction.

When valuing liabilities under point (ii) no adjustment to take account of the own credit standing of the insurance or reinsurance undertaking shall be made.

V.3. Valuation of all assets and liabilities, other than technical provisions, should be carried out, unless otherwise stated in conformity with international accounting standards as adopted by the European Commission in accordance with Regulation (EC) No 1606/2002. If those standards allow for more than one valuation method, only valuation methods that are consistent with Article 75 of Directive 2009/138/EC can be used. In most cases those international accounting standards, herein referred to as “IFRSs”, are considered to provide valuation consistent with principles of Solvency II. Also, the IFRSs’ accounting bases, such as the definitions of assets and liabilities as well as the recognition and derecognition criteria, are applicable, unless otherwise stated. IFRSs also refer to a few basic presumptions, which are also applicable:

- The going concern assumption.
- Individual assets and liabilities are valued separately.
- The application of materiality, whereby the omissions or misstatements of items are material if they could, individually or collectively, influence the economic decisions that users make on the basis of the Solvency II balance sheet. Materiality depends on the size and nature of the omission or misstatement judged in the surrounding circumstances. The size or nature of the item, or a combination of both, could be the determining factor.

- V.4. IFRSs do  always require an economic valuation as envisaged by Article 75 of Directive 2009/138/EC. For those cases, subsection V.1.4. provides specific guidance for the application of IFRSs.
- V.5. On this basis, the following hierarchy of high level principles for valuation of assets and liabilities should be used:
- i. Undertakings must use quoted market prices in active markets for the same assets or liabilities.
 - ii. Where the use of quoted market prices for the same assets or liabilities is not possible, quoted market prices in active markets for similar assets and liabilities with adjustments to reflect differences shall be used.
 - iii. If there are no quoted market prices in active markets available, undertakings should use mark-to-model techniques, which are alternative valuation techniques that have to be benchmarked, extrapolated or otherwise calculated as far as possible from a market input.
 - iv. Undertakings have to make maximum use of relevant observable inputs and market inputs and rely as little as possible on undertaking-specific inputs, minimising the use of unobservable inputs.
 - v. When valuing liabilities using fair value, the adjustment to take account of the own credit standing as required by IFRS 13 Fair Value Measurement has to be eliminated. In addition, when valuing *financial* liabilities subsequently after initial recognition, the adjustment to take account of the own credit standing as required by IFRS 13 Fair Value Measurement and as defined by IFRS 7 Financial Instruments: Disclosures has to be eliminated.
- V.1.2.** Guidance for marking to market and marking to model
- V.6. Undertakings should use the guidance on fair value measurement within IFRS 13. The undertakings can benefit from, for example, the illustrative characteristics of inactive markets as described in IFRS 13.
- V.1.3.** Specific recognition and valuation requirements for selected Solvency II balance sheet items
- V.7. Intangible assets : Goodwill is to be valued at zero. Other intangible assets can be recognised and measured at a value other than zero only if they can be sold separately and if there is a quoted market price in an active market for the same or similar intangible assets.
- V.8. Participations: Holdings in related undertakings are to be valued at the quoted market price in an active market. If this valuation is not possible:

(1) Holdings in insurance and reinsurance undertakings

- Subsidiary undertakings have to be valued with the equity method that is based on a Solvency II consistent recognition and measurement for the subsidiary's balance sheet.
- Related undertakings, other than subsidiaries, would also be valued with the equity method using a Solvency II consistent recognition and measurement for the holding's balance sheet. However, if this is not possible, an alternative valuation method in accordance with the requirements in V1.1. and V1.2 should be used.

(2) Holdings in undertakings other than insurance and reinsurance undertakings

Holdings in undertakings other than insurance and reinsurance undertakings have to be valued with the equity method that is based on a Solvency II consistent recognition and measurement for the subsidiary's balance sheet. If that is not practicable, the equity method would be applied to the related undertaking's balance sheet following IFRSs– with the amendment that goodwill and other intangible assets would need to be deducted. If this is not possible for related undertakings, *other than subsidiaries*, an alternative valuation method in accordance with the requirements in V1.1. and V1.2 should be used.

V.9. Contingent liabilities: For Solvency II purposes, contingent liabilities have to be recognised as liabilities. The valuation of the liability follows the measurement as required in IAS 37 Provisions, contingent liabilities and contingent assets, with the use of the basic risk-free interest rate term structure.

V.10. Deferred Taxes:

Insurance and reinsurance undertakings shall recognise and value deferred tax assets and liabilities in relation to all assets and liabilities that are recognised for solvency or tax purposes in conformity with IFRSs.

Notwithstanding paragraph 1, insurance and reinsurance undertakings shall value deferred taxes, other than deferred tax assets arising from the carryforward of unused tax credits and the carryforward of unused tax losses, on the basis of the difference between the values ascribed to assets and liabilities recognised and valued in accordance with Articles 75 to 86 of Directive 2009/138/EC and the values ascribed to assets and liabilities as recognised and valued for tax purposes.

Insurance and reinsurance undertakings shall only ascribe a positive value to deferred tax assets where it is probable that future taxable profit will be available against which the deferred tax asset can be utilised, taking into account any legal or regulatory requirements on the time limits relating to the carryforward of unused tax losses or the carryforward of unused tax credits.

V.1.4. Consistency of IFSRs with Article 75

IFRS	<p>Summary of IFRS treatment:</p> <p>Measurement principles or options consistent with Article 75 of Directive 2009/138/EC</p>	<p>Fully consistent/ Consistent option/ With adjustments</p>	<p>Applicable?</p>	<p>Other comments</p>
<p>IAS 1 Presentation of financial statements</p>	<p>IAS 1 sets overall requirements for the presentation of financial statements, guidelines for their structure and minimum requirements for their content.</p>		<p>no</p>	<p>IAS 1 does not prescribe valuation methodologies for balance sheet items.</p>
<p>IAS 2 Inventories</p>	<p>IAS 2 prescribes the accounting treatment for inventories.</p> <p>Following IAS 2, inventories shall be measured at the lower of cost and net realisable value (IAS 2.9).</p> <p>Net realisable value refers to the net amount that an entity expects to realise from the sale of inventory in the ordinary course of business while fair value reflects the amount for which the same inventory could be exchanged between knowledgeable and willing buyers and sellers in the marketplace. As the net realisable value is an entity-specific value, may not equal fair value less costs to sell (IAS 2.7).</p> <p>Solvency II framework: In many cases the estimated cost of completion and the estimated costs necessary to make the sale are not material. That means the net realisable value is consistent with Article 75 of Directive 2009/138/EC if the estimated costs of completion and the estimated costs necessary to make the</p>	<p>Net realisable value is a consistent option.</p> <p>Adjustment may be needed where estimated cost are material.</p>	<p> yes</p>	<p>Undertakings shall apply the IAS 2 net realisable value for inventories if the estimated cost of completion and the estimated costs necessary to make the sale are not material.</p>

<p>IAS 34 Interim financial reporting</p>	<p>IAS 34 prescribes the minimum content of an interim financial report and to prescribe the principles for recognition and measurement in complete or condensed financial statements for an interim period.</p>		<p>no</p>	<p>IAS 34 does not prescribe valuation methodologies for balance sheet items.</p>
<p>IAS 36 Impairment of Assets</p>	<p>IAS 36 prescribes the procedures that an entity applies to ensure that its assets are carried at no more than their recoverable amount. An asset is carried at more than its recoverable amount if its carrying amount exceeds the amount to be recovered through use or sale of the asset. If this is the case, the asset is described as impaired and the Standard requires the entity to recognise an impairment loss. The Standard also specifies when an entity should reverse an impairment loss and prescribes disclosures.</p>		<p>no</p>	<p>IAS 36 does not prescribe valuation methodologies relevant for Solvency II balance sheet items.</p>
<p>IAS 37 Provisions, contingent liabilities and contingent assets</p>	<p>IAS 37 establishes the recognition criteria and measurement applied to provisions, contingent liabilities and contingent assets as well as information to be disclosed.</p> <p>Provisions</p> <p>A provision is a liability of uncertain timing or amount (IAS 37. 10). The amount recognised as a provision shall be the best estimate of the expenditure required to settle the present</p>	<p>Consistent measurement principles for provisions.</p>	<p>yes </p>	<p>Contingent liabilities are to be recognised.</p>

IFRS	Summary of IFRS treatment: Measurement principles or options consistent with Article 75 of Directive 2009/138/EC	Fully consistent/ Consistent option/ With adjustments	Applicable?	Other comments
	<p>obligation at the end of the reporting period (IAS 37.36).</p> <p>The best estimate of the expenditure required to settle the present obligation is the amount that an entity would rationally pay to settle the obligation at the end of the reporting period or to transfer it to a third party at that time. It will often be impossible or prohibitively expensive to settle or transfer an obligation at the end of the reporting period. However, the estimate of the amount that an entity would rationally pay to settle or transfer the obligation gives the best estimate of the expenditure required to settle the present obligation at the end of the reporting period (IAS 37.37)</p> <p>Where a single obligation is being measured, the individual most likely outcome may be the best estimate of the liability. However, even in such a case, the entity considers other possible outcomes. Where other possible outcomes are either mostly higher or mostly lower than the most likely outcome, the best estimate will be a higher or lower amount. For example, if an entity has to rectify a serious fault in a major plant that it has constructed for a customer, the individual most likely outcome may be for the repair to succeed at the first attempt at a cost of 1,000, but a provision for a larger amount is made if there is a significant chance that further attempts will be necessary (IAS 37.40).</p> <p>Uncertainties surrounding the amount to be recognised as a</p>			

IFRS	<p>Summary of IFRS treatment:</p> <p>Measurement principles or options consistent with Article 75 of Directive 2009/138/EC</p>	<p>Fully consistent/ Consistent option/ With adjustments</p>	<p>Applicable?</p>	<p>Other comments</p>
	<p>provision are dealt with by various means according to the circumstances. Where the provision being measured involves a large population of items, the obligation is estimated by weighting all possible outcomes by their associated probabilities. The name for this statistical method of estimation is 'expected value'. The provision will therefore be different depending on whether the probability of a loss of a given amount is, for example, 60 per cent or 90 per cent. Where there is a continuous range of possible outcomes, and each point in that range is as likely as any other, the mid-point of the range is used (IAS 37.39).</p> <p>The risks and uncertainties that inevitably surround many events and circumstances shall be taken into account in reaching the best estimate of a provision. (IAS 37.42)</p> <p>The discount rate (or rates) shall be a pre-tax rate (or rates) that reflect(s) current market assessments of the time value of money and the risks specific to the liability. The discount rate(s) shall not reflect risks for which future cash flow estimates have been adjusted (IAS 37.47).</p> <p>Contingent liabilities and contingent assets</p> <p>A contingent liability is: (a) a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future</p>			

IFRS	<p>Summary of IFRS treatment:</p> <p>Measurement principles or options consistent with Article 75 of Directive 2009/138/EC</p>	<p>Fully consistent/ Consistent option/ With adjustments</p>	<p>Applicable?</p>	<p>Other comments</p>
	<p>events not wholly within the control of the entity; or (b) a present obligation that arises from past events but is not recognised because: (i) it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation; or (ii) the amount of the obligation cannot be measured with sufficient reliability (IAS 37.10).</p> <p>A contingent asset is a possible asset that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity.</p> <p>Solvency II framework: The measurement principles for provisions are considered to be consistent with Article 75 of Directive 2009/138/EC.</p> <p>Contingent liabilities are recognised under Solvency II and valued based on the expected present value of future cash-flows required to settle the contingent liability over the lifetime of that contingent liability, using the basic risk-free interest rate term structure.</p>			
<p>IAS 38 Intangible assets</p>	<p>IAS 38 prescribes the accounting treatment for intangible assets that are not dealt with specifically in another Standard. This Standard requires an entity to recognise an intangible asset if, and only if, specified criteria are met. The Standard also specifies</p>	<p>Revaluation model is a consistent option.</p>	<p>yes </p>	<p>Goodwill is valued at zero.</p>

IFRS	<p>Summary of IFRS treatment:</p> <p>Measurement principles or options consistent with Article 75 of Directive 2009/138/EC</p>	<p>Fully consistent/ Consistent option/ With adjustments</p>	<p>Applicable?</p>	<p>Other comments</p>
	<p>how to measure the carrying amount of intangible assets and requires specified disclosures about intangible assets.</p> <p>An entity shall choose either the cost model in paragraph 74 or the revaluation model in paragraph 75 as its accounting policy. If an intangible asset is accounted for using the revaluation model, all the other assets in its class shall also be accounted for using the same model, unless there is no active market for those assets (IAS 38. 72).</p> <p>Cost model: After initial recognition, an intangible asset shall be carried at its cost less any accumulated amortisation and any accumulated impairment losses (IAS 38. 74)</p> <p>Revaluation model: After initial recognition, an intangible asset shall be carried at a revalued amount, being its fair value at the date of the revaluation less any subsequent accumulated amortisation and any subsequent accumulated impairment losses. For the purpose of revaluations: under this Standard, fair value shall be determined by reference to an active market. Revaluations shall be made with such regularity that at the end of the reporting period the carrying amount of the asset does not differ materially from its fair value (IAS 38.75).</p> <p><u>Solvency II framework:</u> The revaluation model is an option consistent with Article 75 of Directive 2009/138/EC for the</p>

DRAFT

V.2. Technical Provisions

Introduction

- TP.1.1. Solvency II requires undertakings to set up technical provisions which correspond to the current amount undertakings would have to pay if they were to transfer their (re)insurance obligations immediately to another undertaking. The value of technical provisions should be equal to the sum of a best estimate (see subsection V.2.2) and a risk margin (see subsection V.2.5). However, under certain conditions that relate to the replicability of the cash flows underlying the (re)insurance obligations, best estimate and risk margin should not be valued separately but technical provisions should be calculated as a whole (see subsection V.2.4).
- TP.1.2. Undertakings should segment their (re)insurance obligations into homogeneous risk groups, and as a minimum by line of business, when calculating technical provisions. Subsection V.2.1 specifies the segmentation of the obligations for the Quantitative Assessment.
- TP.1.3. The best estimate should be calculated gross, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles (SPVs). Those amounts should be calculated separately. The valuation of recoverables is set out in subsection V.2.2.3.
- TP.1.4. The calculation of the technical provisions should take account of the time value of money by using the relevant risk-free interest rate term structure.
- TP.1.5. The actuarial and statistical methods to calculate technical provisions should be proportionate to the nature, scale and complexity of the risks supported by the undertaking. Guidance on the application of the proportionality principle and the specification of simplified methods can be found in subsection V.2.6. Simplified methods for the calculation of the risk margin are included in subsection V.2.5.

V.2.1. Segmentation

General principles

- TP.1.6. Insurance and reinsurance obligations should be segmented as a minimum by line of business (LoB) in order to calculate technical provisions.
- TP.1.7. The purpose of segmentation of (re)insurance obligations is to achieve an accurate valuation of technical provisions. For example, in order to ensure that appropriate assumptions are used, it is important that the assumptions are based on homogenous data to avoid introducing distortions which might arise from combining dissimilar business. Therefore, business is usually managed in more granular homogeneous risk groups than the proposed minimum segmentation by lines of business where it allows for a more accurate valuation of technical provisions.
- TP.1.8. Undertakings in different Member States and even undertakings in the same Member State offer insurance products covering different sets of risks. Therefore it is appropriate for each undertaking to define the homogenous risk group and the level of

granularity most appropriate for their business and in the manner needed to derive appropriate assumptions for the calculation of the best estimate.

- TP.1.9. (Re)insurance obligations should be allocated to the line of business that best reflects the nature of the risks relating to the obligation. In particular, the principle of substance over form should be followed for the allocation. In other words, the segmentation should reflect the nature of the risks underlying the contract (substance), rather than the legal form of the contract (form).
- TP.1.10. The segmentation into lines of business distinguishes between life and non-life insurance obligations. This distinction does not coincide with the legal distinction between life and non-life insurance activities or the legal distinction between life and non-life insurance contracts. Instead, the distinction between life and non-life insurance obligations should be based on the nature of the underlying risk:
- Insurance obligations of business that is pursued on a similar technical basis to that of life insurance should be considered as life insurance obligations, even if they are non-life insurance from a legal perspective.
 - Insurance obligations of business that is not pursued on a similar technical basis to that of life insurance should be considered as non-life insurance obligations, even if they are life insurance from a legal perspective.
- TP.1.11. In particular, annuities stemming from non-life insurance contracts (for example for motor vehicle liability insurance) are life insurance obligations.
- TP.1.12. The segmentation should be applied to both components of the technical provisions (best estimate and risk margin). It should also be applied where technical provisions are calculated as a whole.

Segmentation of non-life insurance and reinsurance obligations

- TP.1.13. Non-life insurance obligations should be segmented into the following 12 lines of business:

Medical expenses insurance

This line of business includes obligations which cover the provision of preventive or curative medical treatment or care including medical treatment or care due to illness, accident, disability and infirmity, or financial compensation for such treatment or care, where the underlying business is not pursued on a similar technical basis to that of life insurance, other than obligations considered as workers' compensation insurance;

Income protection insurance

This line of business includes obligations which cover financial compensation in consequence of illness, accident, disability or infirmity where the underlying business is not pursued on a similar technical basis to that of life insurance, other than obligations considered as medical expenses or workers' compensation insurance;

Workers' compensation insurance

This line of business includes health insurance obligations which relate to accidents at work, industrial injury and occupational diseases and where the underlying business is not pursued on a similar technical basis to that of life insurance covering:

- the provision of preventive or curative medical treatment or care relating to accident at work, industrial injury or occupational diseases; or
- financial compensation for such treatment;
- or financial compensation for accident at work, industrial injury or occupational diseases;

Motor vehicle liability insurance

This line of business includes obligations which cover all liabilities arising out of the use of motor vehicles operating on land (including carrier's liability);

Other motor insurance

This line of business includes obligations which cover all damage to or loss of land vehicles, (including railway rolling stock);

Marine, aviation and transport insurance

This line of business includes obligations which cover all damage or loss to river, canal, lake and sea vessels, aircraft, and damage to or loss of goods in transit or baggage irrespective of the form of transport. This line of business also includes all liabilities arising out of use of aircraft, ships, vessels or boats on the sea, lakes, rivers or canals (including carrier's liability).

Fire and other damage to property insurance

This line of business includes obligations which cover all damage to or loss of property other than motor, marine aviation and transport due to fire, explosion, natural forces including storm, hail or frost, nuclear energy, land subsidence and any event such as theft;

General liability insurance

This line of business includes obligations which cover all liabilities other than those included in motor vehicle liability and marine, aviation and transport;

Credit and suretyship insurance

This line of business includes obligations which cover insolvency, export credit, instalment credit, mortgages, agricultural credit and direct and indirect suretyship;

Legal expenses insurance

This line of business includes obligations which cover legal expenses and cost of litigation;

Assistance insurance

This line of business includes obligations which cover assistance for persons who get into difficulties while travelling, while away from home or while away from their habitual residence;

Miscellaneous financial loss insurance

This line of business includes obligations which cover employment risk, insufficiency of income, bad weather, loss of benefits, continuing general expenses, unforeseen trading expenses, loss of market value, loss of rent or revenue, indirect trading losses other than those mentioned before, other financial loss (not-trading) as well as any other risk of non-life insurance business not covered by the lines of business already mentioned.

TP.1.14. Obligations relating to accepted proportional reinsurance should be segmented into 12 lines of business in the same way as non-life insurance obligations are segmented.

TP.1.15. Obligations relating to accepted non-proportional reinsurance in non-life should be segmented into 4 lines of business as follows:

- Health: non-proportional reinsurance obligations relating to insurance obligations included in the following lines: medical expenses, income protection and workers' compensation.
- Property: non-proportional reinsurance obligations relating to insurance obligations included in the following lines: other motor insurance, fire and other damage to property, credit and suretyship, legal expenses, assistance, miscellaneous financial loss.
- Casualty: non-proportional reinsurance obligations relating to insurance obligations included in the following lines: motor vehicle liability and general liability.
- Marine, aviation and transport: non-proportional reinsurance obligations relating to insurance obligations included in the line marine, aviation and transport insurance

Segmentation of life insurance and reinsurance obligations

TP.1.16. Life insurance obligations should be segmented into 6 lines of business.

Health insurance

Health insurance obligations where the underlying business is pursued on a similar technical basis to that of life insurance, other than those included in the following line of business "Annuities stemming from non-life insurance contracts and relating to health insurance obligations".

Life insurance with profit participation

Insurance obligations with profit participation other than those obligations included in the annuities stemming from non-life insurance contracts.

Index-linked and unit-linked insurance

Insurance obligations with index-linked and unit-linked benefits other than those included in the annuities stemming from non-life insurance.

Other life insurance

obligations other than obligations included in any of the other life lines of business.

Annuities stemming from non-life insurance contracts and relating to health insurance obligations (annuities stemming from non-life contracts and NSLT health insurance).

Annuities stemming from non-life insurance contracts and relating to insurance obligations other than health insurance obligations

TP.1.17. Obligations relating to accepted reinsurance in life should be segmented into 2 lines of business as follows:

Health reinsurance

Reinsurance obligations which relate to the obligations included in lines of business health insurance and "Annuities stemming from non-life insurance contracts and relating to health insurance obligations".

Life reinsurance

Reinsurance obligations which relate to the obligations included in lines of business “Life Insurance with profit participation”, “Index-linked and unit-linked insurance”, “Other life insurance” and “Annuities stemming from non-life insurance contracts and relating to insurance obligations other than health insurance obligations”.

TP.1.18. There could be circumstances where, for a particular line of business in the segment "life insurance with profit participation" (participating business), the insurance liabilities cannot, from the outset, be calculated in isolation from those of the rest of the business. For example, an undertaking may have management rules such that bonus rates on one line of business can be reduced to recoup guaranteed costs on another line of business and/or where bonus rates depend on the overall solvency position of the undertaking. However, even in this case undertakings should assign a technical provision to each line of business in a practicable manner.

Health insurance obligations

TP.1.19. Health insurance covers one or both of the following:

- the provision of preventive or curative medical treatment or care including medical treatment or care due to illness, accident, disability and infirmity, or financial compensation for such treatment or care;
- financial compensation in consequence of illness, accident, disability or infirmity.

TP.1.20. In relation to their technical nature two types of health insurance can be distinguished:

- Health insurance which is pursued on a similar technical basis to that of life insurance (**SLT Health**); or
- Health insurance which is not pursued on a similar technical basis to that of life insurance (**Non-SLT Health**).

TP.1.21. Health insurance obligations pursued on a similar technical basis to that of life insurance (SLT Health) are the health insurance obligations for which it is appropriate to use life insurance techniques for the calculation of the best estimate. Health insurance obligations should be assigned to life insurance lines of business where such obligations are exposed to biometrical risks (i.e. mortality, longevity or disability/morbidity) and where the common techniques used to assess such obligations explicitly take into consideration the behaviour of the variables underlying these risks. Where insurance or reinsurance health obligations are calculated according to the conditions set out in Article 206 of Directive 2009/138/EPC they should be assigned to SLT health insurance lines of business.

TP.1.22. Insurance or reinsurance obligations that, although stemming from Non-Life or NSLT health insurance, and originally segmented into Non-Life or NSLT health lines of business, as a result of the trigger of an event are pursued on a similar technical basis to that of life insurance, should be assigned to the relevant life lines of business as soon as there is sufficient information to assess those obligations using life techniques.

TP.1.23. The definition of health insurance applied in this Technical Specifications Quantitative Assessment may not coincide with national definitions of health insurance used for

authorisation or accounting purposes. Annex C includes further guidance on the definition of health insurance.

TP.1.24. The granularity of the segmentation of insurance or reinsurance obligations should allow for an adequate reflection of the nature of the risks. For the purpose of calculation of the technical provisions, the segmentation should consider the policyholder's right to profit participation, options and guarantees embedded in the contracts and the relevant risk drivers of the obligations.

Unbundling of insurance and reinsurance contracts

TP.1.25. Where a contract includes life and non-life (re)insurance obligations, it should be unbundled into its life and non-life parts.

TP.1.26. Where a contract covers risks across the different lines of business for non-life (re)insurance obligations, these contracts should be unbundled into the appropriate lines of business.

TP.1.27. A contract covering life insurance risks should always be unbundled according to the following lines of business

- SLT
- Life insurance with profit participation
- Index-linked and unit-linked life insurance
- Other life insurance

TP.1.28. Where a contract gives rise to SLT health insurance obligations, it should be unbundled into a health part and a non-health part where it is technically feasible and where both parts are material. Notwithstanding the above, unbundling may not be required where only one of the risks covered by a contract is material. In this case, the contract may be allocated according to the main risk.

V.2.2. Best estimate

V.2.2.1. Methodology for the calculation of the best estimate

Appropriate methodologies for the calculation of the best estimate

TP.2.1. The best estimate should correspond to the probability weighted average of future cash-flows taking account of the time value of money.

TP.2.2. Therefore, the best estimate calculation should allow for the uncertainty in the future cash-flows. The calculation should consider the variability of the cash flows in order to ensure that the best estimate represents the mean of the distribution of cash flow values. Allowance for uncertainty does not suggest that additional margins should be included within the best estimate.

TP.2.3. The best estimate is the average of the outcomes of all possible scenarios, weighted according to their respective probabilities. Although, in principle, all possible scenarios should be considered, it may not be necessary, or even possible, to explicitly incorporate all possible scenarios in the valuation of the liability, nor to develop explicit probability distributions in all cases, depending on the type of risks involved

and the materiality of the expected financial effect of the scenarios under consideration. Moreover, it is sometimes possible to implicitly allow for all possible scenarios, for example in closed form solutions in life insurance or the chain-ladder technique in non-life insurance.

TP.2.4. Cash-flow characteristics that should, in principle and where relevant, be taken into consideration in the application of the valuation technique include the following:

- a) Uncertainty in the timing, frequency and severity of claim events.
- b) Uncertainty in claims amounts, including uncertainty in claims inflation, and in the period needed to settle and pay claims.
- c) Uncertainty in the amount of expenses. Uncertainty in the expected future developments that will have a material impact on the cash in- and out-flows required to settle the insurance and reinsurance obligations over the life time thereof (e.g. the value of an index/market values used to determine claim amounts). For this purpose future developments shall include demographic, legal, medical, technological, social, environmental and economic developments including inflation.
- d) Uncertainty in policyholder behaviour.
- e) Path dependency, where the cash-flows depend not only on circumstances such as economic conditions on the cash-flow date, but also on those circumstances at previous dates.

A cash-flow having no path dependency can be valued by, for example, using an assumed value of the equity market at a future point in time. However, a cash-flow with path-dependency would need additional assumptions as to how the level of the equity market evolved (the equity market's path) over time in order to be valued.

- f) Interdependency between two or more causes of uncertainty.

Some risk-drivers may be heavily influenced by or even determined by several other risk-drivers (interdependence). For example, a fall in market values may influence the (re)insurance undertaking's exercise of discretion in future participation, which in turn affects policyholder behaviour. Another example would be a change in the legal environment or the onset of a recession which could increase the frequency or severity of non-life claims.

TP.2.5. Undertakings should use actuarial and statistical techniques for the calculation of the best estimate which appropriately reflect the risks that affect the cash-flows. This may include simulation methods, deterministic techniques and analytical techniques. Examples for these techniques can be found in Annex B.

TP.2.6. For certain life insurance liabilities, in particular the future discretionary benefits relating to participating contracts or other contracts with embedded options and guarantees, simulation may lead to a more appropriate and robust valuation of the best estimate liability.

TP.2.7. For the estimation of non-life best estimate liabilities as well as life insurance liabilities that do not need simulation techniques, deterministic and analytical techniques can be more appropriate.

Cash-flow projections

TP.2.8. The best estimate should be calculated gross, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles. Recoverables from reinsurance and special purpose vehicles should be calculated separately. In the case of co-insurance the cash-flows of each co-insurer should be calculated as their proportion of the expected cash-flows without deduction of the amounts recoverable from reinsurance and special purpose vehicles.

TP.2.9. Cash-flow projections should reflect expected realistic future demographic, legal, medical, technological, social or economic developments over the lifetime of the insurance and reinsurance obligations.

TP.2.10. Appropriate assumptions for future inflation should be built into the cash-flow projection. Care should be taken to identify the type of inflation to which particular cash-flows are exposed (i.e. consumer price index, salary inflation).

TP.2.11. The cash-flow projections, in particular for health insurance business, should take account of claims inflation and any premium adjustment clauses. It may be assumed that the effects of claims inflation and premium adjustment clauses cancel each other out in the cash flow projection, provided this approach undervalues neither the best estimate, nor the risk involved with the higher cash flows after claims inflation and premium adjustment.

Recognition and derecognition of (re)insurance contracts for solvency purposes

TP.2.12. The calculation of the best estimate should only include future cash-flows associated with recognised obligations within the boundary of the contract.. No future business should be taken into account for the calculation of technical provisions.

TP.2.13. A reinsurance or insurance obligation should be initially recognised by insurance or reinsurance undertakings at whichever is the earlier of the date the undertaking becomes a party to the contract that gives rise to the obligation or the date the insurance or reinsurance cover begins.

TP.2.14. A contract should be derecognised as an existing contract only when the obligation specified in the contract is extinguished, discharged or cancelled or expires.

The boundary of an existing (re)insurance contract

TP.2.15. The definition of the contract boundary should be applied in particular to decide whether options to renew the contract, to extend the insurance coverage to another person, to extend the insurance period, to increase the insurance cover or to establish additional insurance cover gives rise to a new contract or belongs to the existing contract. Where the option belongs to the existing contract the provisions for policyholder options should be taken into account.

TP.2.16. Insurance and reinsurance undertakings should ensure that the principles laid down in the following paragraphs for determining the contract boundaries are consistently applied to all insurance and reinsurance contracts, in particular over time.

TP.2.17. All obligations relating to the contract, including obligations relating to unilateral rights of the insurance or reinsurance undertaking to renew or extend the scope of the contract and obligations that relate to paid premiums, should belong to the contract unless otherwise stated in the following paragraphs.

TP.2.18. Any obligations which relate to insurance or reinsurance cover which might be provided by the undertaking after any of the following date do not belong to the contract, unless the undertaking can compel the policy holder to pay the premium for those obligations:

- (a) the future date where the insurance or reinsurance undertaking has a unilateral right to terminate the contract;
- (b) the future date where the insurance or reinsurance undertaking has a unilateral right to reject premiums payable under the contract; or
- (c) the future date where the insurance or reinsurance undertaking has a unilateral right to amend the premiums or the benefits payable under the contract in such a way that the premiums fully reflect the risks.

Where an insurance or reinsurance undertaking has a unilateral right to amend at a future date the premiums or benefits of a portfolio of insurance or reinsurance obligations in such a way that the premiums of the portfolio fully reflect the risks covered by the portfolio, the undertaking's unilateral right to amend the premiums or benefits of those obligations shall fall under point (c). For the purpose this paragraph, a 'portfolio of insurance or reinsurance obligations' means a set of obligations for which the insurance or reinsurance undertaking can amend premiums and benefits under similar circumstances and with similar consequences.

In derogation from the second subparagraph of this paragraph, in the case of life insurance obligations where an individual risk assessment of the obligations relating to the insured person of the contract is carried out at the inception of the contract and that assessment cannot be repeated before amending the premiums or benefits, insurance and reinsurance undertakings shall assess at the level of the contract whether the premiums fully reflect the risk for the purposes of point (c). For the purpose of this paragraph, an 'individual risk assessment' means any individual assessment of relevant features of the insured person that allow the undertaking to gather sufficient information in order to form an appropriate understanding of the risks associated with the insured person. In the case of contracts covering mortality risks or health risks similar to life insurance techniques, the individual risk assessment can be a self-assessment by the insured person or can include a medical examination or survey.

TP.2.19. For the purpose of points (a) to (c) of point TP2.18, insurance and reinsurance undertakings should consider the right to terminate, reject premiums, or amend the premiums or benefits payable under the contract, as being unilateral, when neither the policy holder nor any third party can restrict the exercise of that right. For the purpose of this paragraph, third parties do not include supervisory authorities. In particular:

- (a) where, in order to get the amendment of premiums and benefits into effect, the insurance or reinsurance undertaking is required to obtain an external assessment in accordance with the law or the terms or conditions of another agreement outside the insurance contract, the existence of such a requirement should limit the unilateral right of the undertaking only if the assessment gives

the policy holder or any third party the right to interfere with the use of that right.

- (b) undertakings should not consider reputational risk or competitive pressures as limitations of the unilateral right.
- (c) undertakings should consider that national laws limit their unilateral right only if these laws restrict, or give the policyholder or any third party the right to restrict the exercise of that right. Undertakings should disregard the right to unilaterally amend premiums or the benefits payable under the contract if the premiums or benefits payable depend solely on the decisions of the policy holder or the beneficiary.

Insurance and reinsurance undertakings should however ignore restrictions of the unilateral right and limitations of the extent by which premiums and benefits can be amended that have no discernible effect on the economics of the contract.

In some jurisdictions the undertakings may amend the premiums and benefits only if another body consisting e.g. of representatives of policyholders agree on this. In regard to point a) of this paragraph, to determine whether such a body should be considered as third party, undertakings should assess the scope of its responsibilities and the extent to which such a body is integrated into the structure and management of the undertaking. If the result of the assessment is that the body forms part of the management of the undertaking, this type of body should not be considered as third party and its decisions or opinions should be seen as they had been taken by the undertaking. Where the body is performing an oversight function independent of the undertaking, it should be considered as third party for the purposes of the first subparagraph of this paragraph.

Some premium or benefit changes agreed upon at inception of the contract may depend on factors beyond the control of the undertaking (e.g. inflation, increase of salary). Such a change should not be considered an amendment in terms of contract boundaries provided that the same premium structure as agreed at the inception of the policy is used. E.g. lapses of such policies should be considered as being policy holder behaviour in accordance with TP.2.128 to TP.2.134. The terms and conditions within insurance policies often set out payment or benefit plan(s). The mere existence of such an agreement itself does not imply that the change would be amendment in terms of contract boundaries.

TP.2.20. Where the insurance or reinsurance undertaking has a unilateral right as referred to in paragraph TP.2.18 that relates only to a part of the contract, the same principles as defined in paragraph TP.2.18 shall be applied to this part.

TP.2.21. Notwithstanding paragraphs TP.2.18 and TP.2.19, any obligations that do not relate to premiums which have already been paid do not belong to an insurance or reinsurance contract, unless the undertaking can compel the policy holder to pay the future premium, where the contract:

- (a) does not provide compensation for a specified uncertain event that adversely affects the insured person;
- (b) does not include a financial guarantee of benefits.

For the purpose of points (a) and (b), insurance and reinsurance undertakings should ignore coverage of events and guarantees that have no discernible effect on the economics of the contract.

TP.2.22. When determining whether the insurance coverage of an event or a financial guarantee has no discernible effect on the economics of a contract as referred to in paragraph TP.2.21, insurance and reinsurance undertakings should take into account all potential future cash-flows which may arise from the contract.

Insurance and reinsurance undertakings should consider the cover of a specified uncertain event that adversely affects the insured person as having a discernible effect on the economics of the contract when the cover provides a discernible financial advantage to the beneficiary.

Insurance and reinsurance undertakings should consider a financial guarantee of benefits as having a discernible effect on the economics of a contract if and only if the financial guarantee is linked to the payment of the future premiums and provides the policyholder with a discernible financial advantage in at least one scenario with commercial substance.

TP.2.23. Notwithstanding paragraphs TP.2.18 and TP.2.19, where an insurance or reinsurance contract can be unbundled into two parts and where one of these parts meets the requirements set out in points (a) and (b) of paragraph TP.2.21, any obligations that do not relate to the premiums of that part which have already been paid do not belong to the contract, unless the undertaking can compel the policy holder to pay future premium of that part.

TP.2.24. When an option or guarantee covers more than one part of the contract, the undertaking should determine whether it is possible to unbundle it or whether it should be attributed to the relevant part of the contract. Insurance and reinsurance undertakings should ensure that if insurance or reinsurance undertakings unbundle contracts, all provisions relating to such contracts are applied to the different parts of the unbundled contract according to their nature.

The set of obligations attributed to a part of the contract can be constituted by obligations of various types, including obligations expressed as financial options or guarantees which can be automatically triggered or exercised at the discretion of the policy holder or of any other party. For the purpose of paragraph TP.2.23, insurance or reinsurance undertakings should determine whether it is possible to unbundle a contract:

- (a) by assessing whether, on the day at which the valuation is made or at a future date, two or more parts of the contract are clearly identifiable, and for which it is possible to define, in an objective manner, different sets of obligations and premiums attributable to each part; and
- (b) by assessing whether it would be possible to communicate obligations of each set separately to the policy holder.

Insurance and reinsurance undertakings should consider two sets of obligations as being capable of being communicated separately to the policy holder where one set of obligations can be understood without reference to the other set of obligations. Thus, as an example, when comparing a bundled product with its “unbundled parts”, an undertaking should compare the real product that is actually sold with notional

products that could be sold, i.e. products with the same (aggregated) premiums, obligations, and expenses. It should be possible at least in theory that the policyholder could pay the premium separately for each unbundled part, if required. The same applies also riders of the policy.

TP.2.25. Insurance and reinsurance undertakings should regard premiums to fully reflect the risks covered by a portfolio of insurance or reinsurance obligations in accordance with TP.2.18 (c), only where at the moment at which either premiums or benefits can be amended there is no circumstance when the undertaking does not have the right to amend premiums or benefits such that the expected present value of the premiums exceeds the expected present value of benefits and expenses payable under the portfolio. When assessing whether the expected present value of the premiums exceeds the expected present value of benefits and expenses payable under the portfolio, there is no need to calculate these values on a policy-by-policy basis, but an overall assessment on portfolio level is satisfactory.

TP.2.26. For the purpose of paragraphs TP.2.18, TP.2.21 and TP.2.23, insurance and reinsurance undertakings shall recognise their ability to compel a policy holder to pay a premium only if the policyholder's payment is legally enforceable. For instance, the holding by the insurance undertaking of the Bank Identifier Code of policy holders shall not be characterized as a means for insurers to compel policy holders to pay the premiums in particular for contracts with scheduled future premiums.

TP.2.27. Insurance and reinsurance undertakings should, where details of a contract or the full extent of the obligations covered by a contract are not available to the undertaking at the time of the recognition of the contract, estimate the boundaries of the contracts using all the available information in a manner consistent with the principles set out in these technical specifications.

For instance, a need to reassess the contract boundaries can arise, where a delegated underwriting authority or binder exists which can sign business on behalf of the undertaking. The undertaking requires information on the underlying insurance contracts written within the binder to assess the contracts which fall within the contract boundary at a given valuation date. If this information is not available, estimates need to be made.

Estimates of contracts entered into can be based on historical experience of specific binders in terms of numbers of contracts likely to be entered into and their terms and conditions and hence the length of their contract boundaries and likely corresponding cash-flows.

The undertaking should revise this estimated assessment as soon as more detailed information is available.

TP.2.28. Insurance and reinsurance undertakings should, for their accepted reinsurance contracts, apply the specifications stated above independently from the boundaries of the underlying insurance or reinsurance contracts to which they relate. The boundary of a reinsurance contract may hence be different in the Solvency II balance sheet of the buyer of the reinsurance when compared to the Solvency II balance sheet of the seller of the reinsurance.

Annex D includes several examples that illustrate the application of the definition of the contract boundary.

Time horizon

- TP.2.29. The projection horizon used in the calculation of best estimate should cover the full lifetime of all the cash in- and out-flows required to settle the obligations related to existing insurance and reinsurance contracts on the date of the valuation, unless an accurate valuation can be achieved otherwise.
- TP.2.30. The determination of the lifetime of insurance and reinsurance obligations should be based on up-to-date and credible information and realistic assumptions about when the existing insurance and reinsurance obligations will be discharged or cancelled or expired.

Gross cash in-flows

- TP.2.31. To determine the best estimate the following non-exhaustive list of cash in-flows should be included:
- Future premiums; and
 - Receivables for salvage and subrogation.
- TP.2.32. The cash in-flows should not take into account investment returns (i.e. interests earned, dividends, etc.).

Gross cash out-flows

- TP.2.33. The cash out-flows could be divided between benefits to the policyholders or beneficiaries, expenses that will be incurred in servicing insurance and reinsurance obligations, and other cash-flow items such as taxation payments which are charged to policyholders.

Benefits

- TP.2.34. The benefit cash out-flows (non-exhaustive list) should include:
- Claims payments
 - Maturity benefits
 - Death benefits
 - Disability benefits
 - Surrender benefits
 - Annuity payments
 - Profit sharing bonuses

Expenses

- TP.2.35. In determining the best estimate, the undertaking should take into account all cash-flows arising from expenses that will be incurred in servicing all recognised insurance and reinsurance obligations over the lifetime thereof. This should include (non-exhaustive list):

- Administrative expenses
 - Investment management expenses
 - Claims management expenses / handling expenses
 - Acquisition expenses
 - Overhead expenses included in the expenses mentioned above
- TP.2.36. Expenses in respect of reinsurance contracts and special purpose vehicles shall be taken into account in the gross calculation of the best estimate.
- TP.2.37. Expenses shall be projected on the assumption that the undertaking will write new business in the future.
- TP.2.38. Expenses that are pertinent to the valuation of technical provisions would usually include both allocated and overhead expenses. Allocated expenses are those expenses which could be directly assignable to the source of expense that will be incurred in servicing insurance and reinsurance obligations. Overhead expenses comprise all other expenses which the undertaking incurs in servicing insurance and reinsurance obligations.
- TP.2.39. Overhead expenses include, for example, salaries to general managers, auditing costs and regular day-to-day costs i.e. utility bills, rent for accommodations, IT costs. These overhead expenses also include expenses related to the development of new insurance and reinsurance business, advertising insurance products, improvement of the internal processes such as investment in system required to support insurance and reinsurance business (e.g. buying new IT system and developing new software).
- TP.2.40. Overhead expenses should be allocated in a realistic and objective manner and on a consistent basis over time to the parts of the best estimate to which they relate.
- TP.2.41. Administrative expenses are expenses which are connected with policy administration including expenses in respect of reinsurance contracts and special purpose vehicles. Some administrative expenses relate directly to insurance contracts or contract activity (e.g. maintenance cost) such as cost of premium billing, cost of sending regular information to policyholders and cost of handling policy changes (e.g. conversions and reinstatements). Other administrative expenses relate directly to insurance contracts or contract activity but are a result of activities that cover more than one policy such as salaries of staff responsible for policy administration.
- TP.2.42. Investment management expenses are usually not allocated on a policy by policy basis but at the level of a portfolio of insurance contracts. Investment management expenses could include expenses of recordkeeping of the investments' portfolio, salaries of staff responsible for investment, remunerations of external advisers, expenses connected with investment trading activity (i.e. buying and selling of the portfolio securities) and in some cases also remuneration for custodial services. Investment management expenses have to be based on a portfolio of assets appropriate to cover their portfolio of obligations. In case the future discretionary benefits depend on the assets held by the undertaking and for unit-linked contracts the undertaking should ensure that the future investment management expenses allow for the expected changes to the future aforementioned portfolio of assets. In

particular, a dynamic expense allowance should be used to reflect a dynamic asset strategy.

- TP.2.43. Usually investment management expenses differ regarding different assets classes. To ensure that investment management expenses will properly reflect the characteristics of the portfolio, investment management expenses in relation to different assets will be based on existing and predicted future split of assets.
- TP.2.44. Investment management expenses are considered as cash out-flow in the calculation of the best estimate since discounting is made with a yield curve gross of investment expenses.
- TP.2.45. Claims management expenses are expenses that will be incurred in processing and resolving claims, including legal and adjuster's fees and internal costs of processing claims payments. Some of these expenses could be assignable to individual claim (e.g. legal and adjuster's fees), others are a result of activities that cover more than one claim (e.g. salaries of staff of claims handling department).
- TP.2.46. Acquisition expenses include expenses which can be identified at the level of individual insurance contract and have been incurred because the undertaking has issued that particular contract. These are commission costs, costs of selling, underwriting and initiating an insurance contract that has been issued.
- TP.2.47. Undertakings should value and take into account charges for embedded options in the valuation of the technical provisions where possible. For life insurance contracts with embedded options it is rather common that for the cost of the embedded option only a minor charge is made up front and that the remainder is due in an extended period of time. This does not necessarily have to be the total time until maturity and is in general not necessary fixed or known exactly in advance. Charges from embedded options are taken into account in the best estimate valuation of technical provisions and they are kept separately from expense loadings. For example a surrender charge could possibly be seen as a charge to offset the uncollected charges in average, but could also be seen as a way to force the policyholder to continue the contract and hence it would not directly be related to the cost of embedded options. Expenses connected with activities which are not linked with servicing insurance and reinsurance obligations are not taken into account when calculating technical provisions. Such expenses could be for example company pension scheme deficits, holding companies' operational expenses connected with expenses linked to entities which are not insurance or reinsurance undertakings. Undertaking should consider their own analysis of expenses and any relevant data from external sources such as average industry or market data. Undertakings should assess the availability of market data on expenses by considering the representativeness of the market data relative to the portfolio and the credibility and reliability of the data.
- TP.2.48. Where average market information is used, consideration needs to be given as to the representativeness of the data used to form that average. For example, market information is not deemed to be sufficiently representative where the market information has material dispersion in representativeness of the portfolios whose data have been used to calculate such market information. The assessment of credibility considers the volume of data underlying the market information.
- TP.2.49. Assumptions with respect to future expenses arising from commitments made on or prior to the date of valuation have to be appropriate and take into account the type of

expenses involved. Undertakings should ensure that expense assumptions allow for future changes in expenses and such an allowance for inflation is consistent with the economic assumptions made. Future expense cash flows are usually assumed to vary with assumed rates of general level of expense inflation in a reasonable manner.

- TP.2.50. Relevant market data needs to be used to determine expense assumptions which include an allowance for future cost increase. The correlation between inflation rates and interest rates are taken into account. An undertaking needs to ensure that the allowance for inflation is consistent with the economic assumptions made, which could be achieved if the probabilities for each inflation scenario are consistent with probabilities implied by market interest rates. Furthermore, expense inflation must be consistent with the types of expenses being considered (e.g. different levels of inflation would be expected regarding office space rents, salaries of different types of staff, IT systems, medical expenses, etc.).
- TP.2.51. Any assumptions about the expected cost reduction should be realistic, objective and based on verifiable data and information.
- TP.2.52. For the assessment of the future expenses, undertakings should take into account all the expenses that are directly related to the on-going administration of obligations related to existing insurance and reinsurance contracts, together with a share of the relevant overhead expenses. The share of overheads should be assessed on the basis that the undertaking continues to write further new business. Overhead expenses have to be apportioned between existing and future business based on recent analyses of the operations of the business and the identification of appropriate expense drivers and relevant expense apportionment ratios. Cash flow projections should include, as cash out-flows, the recurrent overheads attributable to the existing business at the calculation date of the best estimate.
- TP.2.53. In order to determine which expenses best reflect the characteristics of the underlying portfolio and to ensure that the technical provisions are calculated in a prudent, reliable and objective manner, insurance and reinsurance undertakings should consider the appropriateness of both market consistent expenses and undertaking specific expenses. If sufficiently reliable, market consistent expenses are not available participants should use undertaking-specific information to determine expenses that will be incurred in servicing insurance and reinsurance obligations provided that the undertaking-specific information is assessed to be appropriate.
- TP.2.54. Expenses, that are determined by contracts between the undertaking and third parties have to be taken into account based on the terms of the contract. In particular, commissions arising from insurance contracts have to be considered based on the terms of the contracts between the undertakings and the sales persons, and expenses in respect of reinsurance are taken into account based on the contracts between the undertaking and its reinsurers.

Tax payments

- TP.2.55. In determining the best estimate, undertakings should take into account taxation payments which are, or are expected to be, charged to policy holders or are required to settle the insurance or reinsurance obligations.

- TP.2.56. Different taxation regimes exist across Member States giving rise to a broad variety of tax rules in relation to insurance contracts. The assessment of the expected cash-flows underlying the technical provisions should take into account any taxation payments which are charged to policyholders, or which would be required to be made by the undertaking to settle the insurance obligations. All other tax payments should be taken into account under other balance sheet items.
- TP.2.57. The following tax payments should be included in the best estimate: transaction-based taxes (such as premium taxes, value added taxes and goods and services taxes) and levies (such as fire service levies and guarantee fund assessments) that arise directly from existing insurance contracts, or that can be attributed to the contracts on a reasonable and consistent basis. Contributions which were already included in companies' expense assumptions (i.e. levies paid by insurance companies to industry protection schemes) should not be included.
- TP.2.58. The allowance for tax payments in the best estimate should be consistent with the amount and timing of the taxable profits and losses that are expected to be incurred in the future. In cases where changes to taxation requirements are substantially enacted, the pending adjustments should be reflected.

Life insurance obligations

- TP.2.59. The cash-flow projections used in the calculation of best estimates for life insurance obligations shall be made separately for each policy. Where the separate calculation for each policy would be an undue burden on the insurance or reinsurance undertaking, it may carry out the projection by grouping policies, provided that the grouping complies with the following requirements:
- (1) There are no significant differences in the nature and complexity of the risks underlying the policies that belong to the same group;
 - (2) the grouping of policies does not misrepresent the risk underlying the policies and does not misstate their expenses;
 - (3) the grouping of policies is likely to give approximately the same results for the best estimate calculation as a calculation on a per policy basis, in particular in relation to financial guarantees and contractual options included in the policies.
- TP.2.60. In certain specific circumstances, the best estimate element of technical provisions may be negative (e.g. for some individual contracts). This is acceptable and undertakings should not set to zero the value of the best estimate with respect to those individual contracts.
- TP.2.61. No implicit or explicit surrender value floor should be assumed for the amount of the market consistent value of liabilities for a contract. This means that if the sum of a best estimate and a risk margin of a contract is lower than the surrender value of that contract there is no need to increase the value of insurance liabilities to the surrender value of the contract.

Non-life insurance obligations

- TP.2.62. The valuation of the best estimate for provisions for claims outstanding and for premium provisions should be carried out separately.

- TP.2.63. With respect to the best estimate for premium provisions, the cash-flow projections relate to claim events occurring after the valuation date and during the remaining in-force period (coverage period) of the policies held by the undertaking (existing policies). The cash-flow projections should comprise all future claim payments and claims administration expenses arising from these events, cash-flows arising from the ongoing administration of the in-force policies and expected future premiums stemming from existing policies falling within the contract boundary.
- TP.2.64. The best estimate of premium provisions from existing insurance and reinsurance contracts should be given as the expected present value of future in- and out-going cash-flows, being a combination of, inter alia:
- cash-flows from future premiums falling within the contract boundary;
 - cash-flows resulting from future claims events;
 - cash-flows arising from allocated and unallocated claims administration expenses;
 - cash-flows arising from ongoing administration of the in-force policies.
- There is no need for the listed items to be calculated separately.
- TP.2.65. With regard to premium provisions, the cash in-flows could exceed the cash out-flows leading to a negative best estimate. This is acceptable and undertakings are not required to set to zero the value of the best estimate. The valuation should take account of the time value of money where risks in the remaining period would give rise to claims settlements into the future.
- TP.2.66. Additionally, the valuation of premium provisions should take account of future policyholder behaviour such as likelihood of policy lapse during the remaining period.
- TP.2.67. With respect to the best estimate for provisions for claims outstanding, the cash-flow projections relate to claim events having occurred before or at the valuation date – whether the claims arising from these events have been reported or not (i.e. all incurred but not settled claims). The cash-flow projections should comprise all future claim payments as well as claims administration expenses arising from these events.
- TP.2.68. In the case of non-life insurance and non-life reinsurance obligations, undertakings should allocate the expenses into homogenous risk groups, as a minimum by line of business according to the segmentation of their obligations used in the calculation of technical provisions. Undertakings should allocate the expenses of non-life insurance and reinsurance obligations to premium provisions and to provisions for claims outstanding.
- TP.2.69. Where non-life insurance policies give rise to the payment of annuities, the approach laid down in the following subsection on substance over form should be followed. Consistent with this, for premium provisions, its assessment should include an appropriate calculation of annuity obligations if a material amount of incurred claims is expected to give rise to the payment of annuities.

Principle of substance over form

- TP.2.70. When discussing valuation techniques for calculating technical provisions, it is common to refer to a distinction between a valuation based on life techniques and a valuation based on non-life techniques. The distinctions between life and non-life techniques are aimed towards the nature of the liabilities (substance), which may not

necessarily match the legal form (form) of the contract that originated the liability. The choice between life or non-life actuarial methodologies should be based on the nature of the liabilities being valued and from the identification of risks which materially affect the underlying cash-flows. This is the essence of the principle of substance over form.

TP.2.71. Traditional life actuarial techniques to calculate the best estimate can be described as techniques that are based on discounted cash-flow models, generally applied on a policy-by-policy basis, which take into account in an explicit manner risk factors such as mortality, survival and changes in the health status of the insured person(s).

TP.2.72. On the other hand, traditional non-life actuarial techniques include a number of different approaches. For example some of the most common being:

- Methodologies based on the projection of run-off triangles, usually constructed on an aggregate basis;
- Frequency/severity models, where the number of claims and the severity of each claim is assessed separately;
- Methodologies based on the estimation of the expected loss ratio or other relevant ratios;
- Combinations of the previous methodologies;

TP.2.73. There is one key difference between life and non-life actuarial methodologies: life actuarial methodologies consider explicitly the probabilities of death, survival, disability and/or morbidity of the insured persons as key parameters in the model, while non-life actuarial methodologies do not.

TP.2.74.

TP.2.75. In practice, in the majority of cases the form will correspond to the substance. However, for example for certain supplementary covers included in life contracts (e.g. accident) may be better suited for an estimation based on non-life actuarial methodologies.

TP.2.76. The following provides additional guidance for the treatment of annuities arising in non-life insurance. The application of the principle of substance over form implies that such liabilities should be valued using methodologies usually applicable to the valuation of life technical provisions. Specifically, guidance is provided in relation to:

- the recognition and segmentation of insurance obligations for the purpose of calculating technical provisions (i.e. the allocation of obligations to the individual lines of business);
- the valuation of technical provisions for such annuities; and
- possible methods for the valuation of technical provisions for the remaining non-life obligations

TP.2.77. The treatment proposed in these specifications for annuities should be extended to other types of liabilities stemming from non-life and health insurance whose nature is deemed similar to life liabilities (such as life assistance benefits), taking into consideration the principle mentioned in the previous paragraph.

Allocation to the individual lines of business

TP.2.78. Where non-life and Non-SLT health insurance policies give rise to the payment of annuities, such liabilities should be valued using techniques commonly used to value life insurance obligations. Such liabilities should be assigned to the lines of business for annuities stemming from non-life contracts.

Valuation of annuities arising from non-life and Non-SLT health insurance contracts

TP.2.79. Undertakings should value the technical provisions related to such annuities separately from the technical provisions related to the remaining non-life and health obligations. They should apply appropriate life insurance valuation techniques. The valuation should be consistent with the valuation of life insurance annuities with comparable technical features.

Valuation of the remaining non-life and health insurance obligations

TP.2.80. The remaining obligations in the undertaking's non-life and Non-SLT health business (which are similar in nature to non-life insurance obligations) have to be valued separately from the relevant block of annuities.

TP.2.81. Where provisions for claims outstanding according to national accounting rules are compared to provisions for claims outstanding as calculated above, it should be taken into account that the latter do not include the annuity obligations.

TP.2.82. Undertakings may use, where appropriate, one of the following approaches to determine the best estimate of claims provisions for the remaining non-life or health obligations in a given non-life or Non-SLT health insurance line of business where annuities are valued separately.

Separate calculation of non-life liabilities

TP.2.83. Under this approach, the run-off triangle which is used as a basis for the determination of the technical provisions should not include any cash-flows relating to the annuities. An additional estimate of the amount of annuities not yet reported and for reported but not yet agreed annuities needs to be added.

Allowance of agreed annuities as single lump-sum payments in the run-off triangle

TP.2.84. This approach also foresees a separate calculation of the best estimate, where the split is between annuities in payment and the remaining obligations.

TP.2.85. Under this approach, the run-off triangle which is used as a basis for the determination of the technical provisions of the remaining non-life or health obligations in a line of business does not include any cash-flows relating to the annuities in payment. This means that claims payments for annuities in payment are excluded from the run-off triangle.

TP.2.86. However, payments on claims before annuitisation¹ and payments at the time of annuitisation remain included in the run-off triangle. At the time of annuitisation, the best estimate of the annuity (valued separately according to life principles) is shown as

¹ The term “annuitisation” denotes the point in time where the undertaking becomes obligated to pay the annuity.

a single lump-sum payment in the run-off triangle, calculated as at the date of the annuitisation. Where proportionate, approximations of the lump sums could be used.

TP.2.87. Where the analysis is based on run-off triangles of incurred claims, the lump sum payment should reduce the case reserves at the date of annuitisation.

TP.2.88. On basis of run-off triangles adjusted as described above, the participant may apply an appropriate actuarial reserving method to derive a best estimate of the claims provision of the portfolio. Due to the construction of the run-off triangle, this best estimate would not include the best estimate related to the annuities in payment which would be valued separately using life principles (i.e. there would be no “double counting” in relation to the separate life insurance valuation), but it includes a best estimate for not yet reported and for reported but not yet agreed annuities.

Expert judgement

TP.2.89. Insurance and reinsurance undertakings shall choose assumptions based on the expertise of persons with relevant knowledge, experience and understanding of the risks inherent in the insurance or reinsurance business thereof (expert judgment). In certain circumstances expert judgement may be necessary when calculating the best estimate, among other:

- in selecting the data to use, correcting its errors and deciding the treatment of outliers or extreme events,
- in adjusting the data to reflect current or future conditions, and adjusting external data to reflect the undertaking’s features or the characteristics of the relevant portfolio,
- in selecting the time period of the data
- in selecting realistic assumptions
- in selecting the valuation technique or choosing the most appropriate alternatives existing in each methodology
- in incorporating appropriately to the calculations the environment under which the undertakings have to run its business.

Obligations in different currencies

TP.2.90. The probability-weighted average cash-flows should take into account the time value of money. The time value of money of future cash-flows in different currencies is calculated using risk-free term structure for relevant currency. Therefore the best estimate should be calculated separately for obligations of different currencies.

Valuation of options and guarantees embedded in insurance contracts

TP.2.91. When calculating the best estimate, insurance and reinsurance undertakings shall identify and take into account:

1. all financial guarantees and contractual options included in their insurance and reinsurance policies;

2. all factors which may affect the likelihood that policy holders will exercise contractual options or the value of the guarantees.

Definition of contractual options and financial guarantees

TP.2.92. A contractual option is defined as a right to change the benefits², to be taken at the choice of its holder (generally the policyholder), on terms that are established in advance. Thus, in order to trigger an option, a deliberate decision of its holder is necessary.

TP.2.93. Some (non-exhaustive) examples of contractual options which are pre-determined in contract and do not require again the consent of the parties to renew or modify the contract include the following:

- Surrender value option, where the policyholder has the right to fully or partially surrender the policy and receive a pre-defined lump sum amount;
- Paid-up policy option, where the policyholder has the right to stop paying premiums and change the policy to a paid-up status;
- Annuity conversion option, where the policyholder has the right to convert a lump survival benefit into an annuity at a pre-defined minimum rate of conversion;
- Policy conversion option, where the policyholder has the right to convert from one policy to another at pre-specified terms and conditions;
- Extended coverage option, where the policyholder has the right to extend the coverage period at the expiry of the original contract without producing further evidence of health.

TP.2.94. A financial guarantee is present when there is the possibility to pass losses to the undertaking or to receive additional benefits³ as a result of the evolution of financial variables (solely or in conjunction with non-financial variables) (e.g. investment return of the underlying asset portfolio, performance of indices, etc.). In the case of guarantees, the trigger is generally automatic (the mechanism would be set in the policy's terms and conditions) and thus not dependent on a deliberate decision of the policyholder / beneficiary. In financial terms, a guarantee is linked to option valuation.

TP.2.95. The following is a non-exhaustive list of examples of common financial guarantees embedded in life insurance contracts:

- Guaranteed invested capital 
- Guaranteed minimum investment return;
- Profit sharing.

TP.2.96. There are also non-financial guarantees, where the benefits provided would be driven by the evolution of non-financial variables, such as reinstatement premiums in reinsurance, experience adjustments to future premiums following a favourable underwriting history (e.g. guaranteed no-claims discount). Where these guarantees are

² This should be interpreted as also including the potential for reduction of the level of premiums that would be charged in the future.

³ This should be interpreted as also including the potential for reduction of the level of premiums that would be charged in the future.

material, the calculation of technical provisions should also take into account their value.

Valuation requirements

- TP.2.97. For each type of contractual option insurers are required to identify the risk drivers which have the potential to affect (directly or indirectly) the frequency of option take-up rates considering a sufficiently large range of scenarios, including adverse ones.
- TP.2.98. The best estimate of contractual options and financial guarantees must capture the uncertainty of cash-flows, taking into account the likelihood and severity of outcomes from multiple scenarios combining the relevant risk drivers.
- TP.2.99. The best estimate of contractual options and financial guarantees should reflect both the intrinsic value and the time value.
- TP.2.100. The best estimate of contractual options and financial guarantees may be valued by using one or more of the following methodologies:
- a stochastic approach using for instance a market-consistent asset model (includes both closed form and stochastic simulation approaches);
 - a series of deterministic projections with attributed probabilities; and
 - a deterministic valuation based on expected cash-flows in cases where this delivers a market-consistent valuation of the technical provision, including the cost of options and guarantees.
- TP.2.101. For the purposes of valuing the best estimate of contractual options and financial guarantees, a stochastic simulation approach would consist of an appropriate market-consistent asset model for projections of asset prices and returns (such as equity prices, fixed interest rate and property returns), together with a dynamic model incorporating the corresponding value of liabilities (incorporating the stochastic nature of any relevant non-financial risk drivers) and the impact of any foreseeable actions to be taken by management.
- TP.2.102. For the purposes of the deterministic approach, a range of scenarios or outcomes appropriate to both valuing the options or guarantees and the underlying asset mix, together with the associated probability of occurrence should be set. These probabilities of occurrence should be weighted towards adverse scenarios to reflect market pricing for risk. The series of deterministic projections should be numerous enough to capture a wide range of possible out-comes (and, in particular, it should include very adverse yet possible scenarios) and take into account the probability of each outcome's likelihood (which may, in practice, need to incorporate judgement). The costs will be understated if only relatively benign or limited economic scenarios are considered.
- TP.2.103. When the valuation of the best estimate of contractual options and financial guarantees is not being done on a policy-by-policy basis, the segmentation considered should not distort the valuation of technical provisions by, for example, forming groups containing policies which are "in the money" and policies which are "out of the money".
- TP.2.104. Regarding contractual options, the assumptions on policyholder behaviour should be appropriately founded in statistical and empirical evidence, to the extent that it is

deemed representative of the future expected behaviour. However, when assessing the experience of policyholders' behaviour appropriate attention based on expert judgements should be given to the fact that when an option is out of or barely in the money, the behaviour of policyholders should not be considered to be a reliable indication of likely policyholders' behaviour when the options are heavily in-the-money.

TP.2.105. Appropriate consideration should also be given to an increasing future awareness of policy options as well as policyholders' possible reactions to a changed financial position of an undertaking. In general, policyholders' behaviour should not be assumed to be independent of financial markets, a firm's treatment of customers or publicly available information unless proper evidence to support the assumption can be observed.

TP.2.106. Where material, non-financial guarantees should be treated like financial guarantees.

Valuation of future discretionary benefits

TP.2.107. In calculating the best estimate, undertakings should take into account future discretionary benefits which are expected to be made, whether or not those payments are contractually guaranteed. Undertakings should not take into account payments that relate to surplus funds which possess the characteristics of Tier 1 basic own funds. Surplus funds are accumulated profits which have not been made available for distribution to policyholders and beneficiaries. (Cf. Article 91 of the Solvency II Framework Directive.)

TP.2.108. When undertakings calculate the best estimate of technical provisions, the value of future discretionary benefits should be calculated separately.

TP.2.109. Future discretionary benefits means benefits of insurance or reinsurance contracts which have one of the following characteristics:

- the benefits are legally or contractually based on one or several of the following results:
 - the performance of a specified pool of contracts or a specified type of contract or a single contract;
 - realised or unrealised investment return on a specified pool of assets held by the insurance or reinsurance undertaking;
 - the profit or loss of the insurance or reinsurance undertaking or fund that issues the contract that gives rise to the benefits;
- the benefits are based on a declaration of the insurance or reinsurance undertaking and the timing or the amount of the benefits is at its discretion.

TP.2.110. Index-linked and unit-linked benefits should not be considered as discretionary benefits.

TP.2.111. The distribution of future discretionary benefits is a management action and assumptions about it should be objective, realistic and verifiable. In particular assumptions about the distribution of future discretionary benefits should take the

relevant and material characteristics of the mechanism for their distribution into account.

TP.2.112. Some examples of characteristics of mechanisms for distributing discretionary benefits are the following. Undertakings should consider whether they are relevant and material for the valuation of future discretionary benefits and take them into account accordingly, applying the principle of proportionality.

- What constitutes a homogenous group of policyholders and what are the key drivers for the grouping?
- How is a profit divided between owners of the undertaking and the policyholders and furthermore between different policyholders?
- How is a deficit divided between owners of the undertaking and the policyholders and furthermore between different policyholders?
- How will the mechanism for discretionary benefits be affected by a large profit or loss?
- How will policyholders be affected by profits and losses from other activities?
- What is the target return level set by the firm's owners on their invested capital?
- What are the key drivers affecting the level of discretionary benefits?
- What is an expected level (inclusive of any distribution of excess capital, unrealised gains etc.) of discretionary benefits?
- How are the discretionary benefits made available for policyholders and what are the key drivers affecting for example the split between reversionary and terminal discretionary benefits, conditionality, changes in smoothing practice, level of discretion by the undertaking, etc.
- How will the experience from current and previous years affect the level of discretionary benefits?
- When is an undertaking's solvency position so weak that declaring discretionary benefits is considered by the undertaking to jeopardize a shareholder's or/and policyholders' interest?
- What other restrictions are in place for determining the level of discretionary benefits?
- What is an undertaking's investment strategy?
- What is the asset mix driving the investment return?
- What is the smoothing mechanism if used and what is the interplay with a large profit or loss?
- What kind of restrictions are in place in smoothing extra benefits?

- Under what circumstances would one expect significant changes in the crediting mechanism for discretionary benefits?
- To what extent is the crediting mechanism for discretionary benefits sensitive to policyholders' actions?

TP.2.113. Where the future discretionary benefits depend on the assets held by the undertaking, the calculation of the best estimate should be based on the current assets held by the undertaking. Future changes of the asset allocation should be taken into account according to the requirements on future management actions.

TP.2.114. The assumptions on the future returns of these assets, valued according to the subsection V.1, should be consistent with the relevant risk-free interest term structure, including where applicable a matching adjustment or a volatility adjustment. Where a risk neutral approach for the valuation is used, the set of assumptions on returns of future investments underlying the valuation of discretionary benefits should be consistent with the principle that they should not exceed the level given by the forward rates derived from the relevant risk-free interest rates.

V.2.2.2. Assumptions underlying the calculation of the best estimate

Assumptions consistent with information provided by financial markets

TP.2.115. Assumptions consistent with information about or provided by financial markets include (non-exhaustive list):

- relevant risk-free interest rate term structure,
- currency exchange rates,
- market inflation rates (consumer price index or sector inflation) and
- economic scenario files (ESF).

TP.2.116. When undertakings derive assumptions on future financial market parameters or scenarios, they should be able to demonstrate that the choice of the assumptions is appropriate and consistent with the valuation principles set out in subsection V.1;

TP.2.117. Where the undertaking uses a model to produce future projections of market parameters (market consistent asset model, e.g. an economic scenario file), the model should comply with the following requirements:

- it generates asset prices that are consistent with deep, liquid and transparent financial markets⁴;
- it assumes no arbitrage opportunity;
- the calibration of the parameters and scenarios is consistent with the relevant risk-free interest rate term structure used to calculate the best estimate as referred to in subsection V.2.2.

TP.2.118. The following principles should be taken into account in determining the appropriate calibration of a market consistent asset model:

⁴ See section V.2.4 on technical provisions as a whole for a definition of "deep, liquid and transparent"

- a) The asset model should be calibrated to reflect the nature and term of the liabilities, in particular of those liabilities giving rise to significant guarantee and option costs.
- b) The asset model should be calibrated to the current risk-free term structure used to discount the cash flows.
- c) The asset model should be calibrated to a properly calibrated volatility measure.

TP.2.119. In principle, the calibration process should use market prices only from financial markets that are deep, liquid and transparent. If the derivation of a parameter is not possible by means of prices from deep, liquid and transparent markets, other market prices may be used. In this case, particular attention should be paid to any distortions of the market prices. Corrections for the distortions should be made in a deliberate, objective and reliable manner.

TP.2.120. A financial market is deep, liquid and transparent, if it meets the requirements specified in the subsection TP.4.4 of these specifications regarding circumstances in which technical provisions should be calculated as a whole.

TP.2.121. The calibration of the above mentioned assets models may also be based on adequate actuarial and statistical analysis of economic variables provided they produce market consistent results. For example:

- a) To inform the appropriate correlations between different asset returns.
- b) To determine probabilities of transitions between credit quality steps and default of corporate bonds.
- c) To determine property volatilities. As there is virtually no market in property derivatives, it is difficult to derive property implied volatility. Thus the volatility of a property index may often be used instead of property implied volatility.

Assumptions consistent with generally available data on insurance and reinsurance technical risks

TP.2.122. Generally available data refers to a combination of:

- Internal data 
- External data sources such as industry or market data.

TP.2.123. Internal data refers to all data which is available from internal sources. Internal data may be either:

- Undertaking-specific data:
- Portfolio-specific data:

TP.2.124. All relevant available data whether external or internal data, should be taken into account in order to arrive at the assumption which best reflects the characteristics of the underlying insurance portfolio. In the case of using external data, only that data to which the undertaking can reasonably be expected to have access should be considered.

The extent to which internal data is taken into account should be based on:

- The availability, quality and relevance of external data.
- The amount and quality of internal data.

TP.2.125. Insurance and reinsurance undertakings may use data from an external source provided the following requirements are met:

- a) Insurance or reinsurance undertakings are able to demonstrate that the use of data from an external source is more suitable than the use of data which are exclusively available from an internal source;
- b) Insurance or reinsurance undertakings know the origin of the data and the assumptions or methodologies used to process that data;
- c) Insurance or reinsurance undertakings identify any trends in the data from an external source and the variation, over time or across data, of the assumptions or methodologies in the use of the data;
- d) Insurance or reinsurance undertaking are able to demonstrate that the assumptions and methodologies referred to in point b) and c) appropriately reflect the characteristics of the insurance or reinsurance undertaking's portfolio of insurance and reinsurance obligations.

Policyholders' behaviour

TP.2.126. Undertakings are required to consider policyholders' behaviour.

TP.2.127. Any assumptions made by insurance and reinsurance undertakings with respect to the likelihood that policyholders will exercise contractual options, including lapses and surrenders, should be realistic and based on current and credible information. The assumptions should take account, either explicitly or implicitly, of the impact that future changes in financial and non-financial conditions may have on the exercise of those options.

TP.2.128. Assumptions about the likelihood that policy holders will exercise contractual options should be based on analysis of past policyholder behaviour and a prospective assessment of expected policy holder behaviour. The analysis should take into account the following:

- (a) how beneficial the exercise of the options was and will be to the policyholders under past circumstances (whether the option is out of or barely in the money or is in the money),
- (b) the influence of past and future economic conditions,
- (c) the impact of past and future management actions,
- (d) any other circumstances that are likely to influence a decision whether to exercise the option.

TP.2.129. The likelihood that policyholders will exercise contractual options, including lapses and surrenders, should not be assumed to be independent of the elements mentioned in points (a) to (d) in the previous paragraph, unless empirical evidence to support such an assumption can be observed or where the impact would not be material.

TP.2.130. In general policyholders' behaviour should not be assumed to be independent of financial markets, of undertaking's treatment of customers or publicly available information unless there is empirical evidence to support such an assumption.

TP.2.131. Policyholder options to surrender are often dependent on financial markets and undertaking-specific information, in particular the financial position of the undertaking.

TP.2.132. Policyholders' option to lapse and also in certain cases to surrender are mainly dependent on the change of policyholders' status such as the ability to further pay the premium, employment, divorce, etc.

Future management actions

TP.2.133. The methods and techniques for the estimation of future cash-flows, and hence the assessment of the provisions for insurance liabilities, should take account of potential future actions by the management of the undertaking.

TP.2.134. As examples, the following should be considered:

- changes in asset allocation, as management of gains/losses for different asset classes in order to gain the target segregated fund return; management of cash balance and equity backing ratio with the aim of maintaining a defined target asset mix in the projection period; management of liquidity according to the asset mix and duration strategy; actions to maintain a stable allocation of the portfolio assets in term of duration and product type, actions for the dynamic rebalancing of the asset portfolio according to movements in liabilities and changes in market conditions;
- changes in bonus rates or product changes, for example on policies with profit participation to mitigate market risks;
- changes in expense charge, for example related to guarantee charge, or related to an increased charging on unit-linked or index-linked business;

TP.2.135. The assumptions on future management actions used in the calculation of the technical provisions should be determined in an objective manner.

TP.2.136. Assumed future management actions should be realistic and consistent with the insurance or reinsurance undertaking's current business practice and business strategy, including the use of risk-mitigating techniques. If there is sufficient evidence that the undertaking will change its practices or strategy, the assumed future management actions are consistent with the changed practices or strategy.

TP.2.137. Assumed future management actions should be consistent with each other.

TP.2.138. Insurance and reinsurance undertakings should not assume that future management actions would be taken that would be contrary to their obligations towards policyholders and beneficiaries or to legal provisions applicable to the insurance and reinsurance undertakings.

TP.2.139. The assumed future management actions should take account of any public indications by the insurance or reinsurance undertaking as to the actions that it would expect to take, or not take in the circumstances being considered.

- TP.2.140. Assumptions about future management actions should take account of the time needed to implement the management actions and any expenses caused by them.
- TP.2.141. Insurance and reinsurance undertakings should be able to verify that assumptions about future management actions are realistic through:
- (a) a comparison of assumed future management actions with management actions taken previously by the insurance or reinsurance undertaking;
 - (b) a comparison of future management actions taken into account in the current and past calculations of the best estimate;
 - (c) an assessment of the impact of changes in the assumptions of future management actions on the value of the technical provisions.

V.2.2.3. Recoverables

Recoverables from reinsurance contracts and special purpose vehicles

- TP.2.142. The best estimate should be calculated gross, without deduction of amounts recoverable from reinsurance contracts and special purpose vehicles. Those amounts should be calculated separately
- TP.2.143. The calculation by insurance and reinsurance undertakings of amounts recoverable from reinsurance contracts and special purpose vehicles should follow the same principles and methodology as presented in this section for the calculation of other parts of the technical provisions.
- TP.2.144. There is no need however to calculate a risk margin for amounts recoverable from reinsurance contracts and special purpose vehicles because the single net calculation of the risk margin should be performed, rather than two separate calculations (i.e. one for the risk margin of the technical provisions and one for the risk margin of recoverables from reinsurance contracts and special purpose vehicles). Where undertakings calculate a risk margin using an internal model, they can either perform one single net calculation or two separate calculations.
- TP.2.145. When calculating amounts recoverable from reinsurance contracts and special purpose vehicles, insurance and reinsurance undertakings should take account of the time difference between recoveries and direct payments.
- Where for certain types of reinsurance and special purpose vehicles, the timing of recoveries and that for direct payments of undertaking markedly diverge, this should be taken into account in the projection of cash-flows. Where such timing is sufficiently similar to that for direct payments, the undertaking should have the possibility of using the timing of direct payments.
- TP.2.146. The amounts recoverable from reinsurance contracts and special purpose vehicles shall be calculated consistently with the boundaries of the insurance and reinsurance contracts to which the amounts recoverable from reinsurance contracts and special purpose vehicle relate.

- TP.2.147. The amounts recoverable from special purpose vehicles, the amounts recoverable from finite reinsurance⁵ contracts and the amounts recoverable from other reinsurance contracts should each be calculated separately. The amounts recoverable from a special purpose vehicle should not exceed the aggregate maximum risk exposure of this special purpose vehicle to the insurance or reinsurance undertaking.
- TP.2.148. For the purpose of calculating the amounts recoverable from reinsurance contracts and special purpose vehicles, the cash-flows should only include payments in relation to compensation of insurance events and unsettled insurance claims. Payments in relation to other events or settled insurance claims should not be accounted as amounts recoverable from reinsurance contracts and special purpose vehicles. Where a deposit has been made for the mentioned cash-flows, the amounts recoverable should be adjusted accordingly to avoid a double counting of the assets and liabilities relating to the deposit.
- TP.2.149. Debtors and creditors that relate to settled claims of policyholders or beneficiaries should not be included in the recoverable.
- TP.2.150. The best estimate of amounts recoverable from reinsurance contracts and special purpose vehicles for non-life insurance obligations should be calculated separately for premium provisions and provisions for claims outstanding:
- (a) the cash-flows relating to provisions for claims outstanding should include the compensation payments relating to the claims accounted for in the gross provisions for claims outstanding of the insurance or reinsurance undertaking ceding risks;
 - (b) the cash-flows relating to premium provisions should include all other payments.
- TP.2.151. If payments from the special purpose vehicles to the insurance or reinsurance undertaking do not directly depend on the claims against the insurance or reinsurance undertaking ceding risks (for example if payments are made according to certain external indicators, such as an earthquake index or general population mortality), the amounts recoverable from these special purpose vehicles for future claims should only be taken into account to the extent it can be verified in a prudent, reliable and objective manner that the structural mismatch between claims and amounts recoverable (basis risk) is not material and where the underlying risks are adequately reflected in the calculation of the Solvency Capital Requirement.
- TP.2.152. A compensation for past and future policyholder claims should only be taken into account to the extent it can be verified in a deliberate, reliable and objective manner.
- TP.2.153. Expenses which the undertaking incurs in relation to the management and administration of reinsurance and special purpose vehicle contracts should be allowed for in the best estimate, calculated gross, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles. But no allowance for expenses relating to the internal processes should be made in the recoverables.

⁵ as referred to in Article 210 of the Solvency 2 Framework Directive (Directive 2009/138/EC)

Counterparty default adjustment

Definition of the adjustment

- TP.2.154. The result from the calculation of the previous section should be adjusted to take account of expected losses due to default of the counterparty. That adjustment should be calculated separately and should be based on an assessment of the probability of default of the counterparty, whether this arises from insolvency, dispute or another reason, and the average loss resulting there from (loss-given-default). For this purpose, the change in cash-flows shall not take into account the effect of any risk mitigating technique that mitigates the credit risk of the counterparty. These risk mitigating techniques shall be separately recognised without increasing the amount recoverable from reinsurance contracts and special purpose vehicles.
- TP.2.155. The adjustment should be calculated as the expected present value of the change in cash-flows underlying the amounts recoverable from that counterparty, resulting from a default of the counterparty at a certain point in time.
- TP.2.156. This calculation should take into account possible default events over the lifetime of the rights arising from the corresponding reinsurance contract or special purpose vehicle and the dependence on time of the probability of default.
- TP.2.157. For example, let the recoverables towards a counterparty correspond to deterministic payments of C_1 , C_2 , C_3 in one, two and three years respectively. Let P_{Dt} be the probability that the counterparty defaults during year t . Furthermore, we assume that the counterparty will only be able to make 40% of the further payments in case of default (i.e. its recovery rate is 40%). For the sake of simplicity, this example does not consider the time value of money. (However, its allowance, would not change the fundamental conclusions of the example). Then the losses-given-default are as follows:

Default during year	Loss-given-default
1	$-60\% \cdot (C_1 + C_2 + C_3)$
2	$-60\% \cdot (C_2 + C_3)$
3	$-60\% \cdot C_3$

For instance, in year two the value of the recoverables is equal to $C_2 + C_3$. If the counterparty defaults in year two the value of the recoverables changes from $C_2 + C_3$ to $40\% \cdot (C_2 + C_3)$. As 60% of the recoveries are lost, the loss-given-default is $-60\% \cdot (C_2 + C_3)$.

- TP.2.158. The adjustment for counterparty default in this example is the following sum:

$$Adj_{CD} = -0.6 \cdot (PD_1 \cdot (C_1 + C_2 + C_3) + PD_2 \cdot (C_2 + C_3) + PD_3 \cdot C_3)$$

- TP.2.159. This calculation should be carried out separately by counterparty and each line of business, and in non-life insurance for premium provisions and provisions for claims outstanding.

Probability of default (PD)

TP.2.160. The determination of the adjustment for counterparty default should take into account possible default events during the whole run-off period of the recoverables.

TP.2.161. In particular, if the run-off period of the recoverables is longer than one year, then it is not sufficient to multiply the expected loss in case of immediate default of the counterparty with the probability of default over the following year in order to determine the adjustment. In the above example, this approach would lead to an adjustment of

$$-0.6 \cdot PD_1 \cdot (C_1 + C_2 + C_3)$$

TP.2.162. Such an approach is not appropriate because it ignores the risk that the counterparty may – after surviving the first year – default at a later stage during the run-off of the recoverables.

TP.2.163. The assessment of the probability of default and the loss-given-default of the counterparty should be based upon current, reliable and credible information. Among the possible sources of information are: credit spreads, credit quality steps, judgements, information relating to the supervisory solvency assessment, and the financial reporting of the counterparty. The applied methods should guarantee market consistency. The undertaking should not rely on information of a third party without assessing that the information is current, reliable and credible.

TP.2.164. In particular, the assessment of the probability of default should be based on methods that guarantee the market consistency of the estimates of PD.

TP.2.165. Some criteria to assess the reliability of the information might be, e.g., neutrality, prudence and completeness in all material aspects.

TP.2.166. The undertaking may consider for this purpose methods generally accepted and applied in financial markets (i.e., based on CDS markets), provided the financial information used in the calculations is sufficiently reliable and relevant for the purposes of the adjustment of the recoverables from reinsurance.

TP.2.167. In the case of reinsurance recoverable from a SPV, the probability of default of special purpose vehicles should be calculated according to the average credit quality step of assets held by the special purpose vehicle, unless there is a reliable basis for an alternative calculation. When the undertaking has no reliable source to estimate its probability of default, (i.e. there is a lack of credit quality step) the following rules should apply:

- SPV authorised under EU regulations: the probability of default should be calculated according to the average rating of assets and derivatives held by the SPV in guarantee of the recoverable.
- Other SPV where they are recognised as equivalent to those authorised under CP36: Same treatment as in the case referred above.
- Other SPV: They should be considered as unrated.

TP.2.168. Where possible in a reliable, objective and prudent manner, point-in-time estimates of the probability of default should be used for the calculation of the adjustment. In

this case, the assessment should take the possible time-dependence of the probability of default into account. If point-in-time estimates are not possible to calculate in a reliable, objective and prudent manner or their application would not be proportionate, through-the-cycle estimates of the probability of default might be used.

TP.2.169. A usual assumption about probabilities of default is that they are not constant over time. In this regard it is possible to distinguish between point-in-time estimates which try to determine the current default probability and through-the-cycle estimates which try to determine a long-time average of the default probability.

TP.2.170. In many cases only through-the-cycle estimates may be available. For example, the credit quality steps of rating agencies are usually based on through-the-cycle assessments. Moreover, the sophisticated analysis of the time dependence of the probability of default may be disproportionate in most cases. Hence, through-the-cycle estimates might be used if point-in-time estimates cannot be derived in a reliable, objective and prudent manner or their application would not be in line with the proportionality principle. If through-the-cycle estimates are applied, it can usually be assumed that the probability of default does not change during the run-off of the recoverables.

TP.2.171. The assessment of the probability of default should take into account the fact that the cumulative probability increases with the time horizon of the assessment.

TP.2.172. For example, the probability that the counterparty defaults during the next two years is higher than the probability of default during the next year.

TP.2.173. Often, only the probability of default estimate PD during the following year is known. For example, if this probability is expected to be constant over time, then the probability PD_t that the counterparty defaults during year t can be calculated as

$$PD_t = PD \cdot (1 - PD)^{t-1}.$$

TP.2.174. This does not preclude the use of simplifications where their effect is not material to this aspect (see below).

Recovery rate (RR)

TP.2.175. The recovery rate is the share of the debts that the counterparty will still be able to honour in case of default

TP.2.176. If no reliable estimate of the recovery rate of a counterparty is available, no rate higher than 50% should be used.

TP.2.177. The degree of judgement that can be used in the estimation of the recovery rate should be restricted, especially where owing to a low number of defaults, little empirical data about this figure in relation to reinsurers is available, and hence, estimations of recovery rates are unlikely to be reliable.

TP.2.178. The average loss resulting from a default of a counterparty should include an estimation of the credit risk of any risk-mitigating instruments that the counterparty provided to the insurance or reinsurance undertaking ceding risks to the counterparty⁶.

TP.2.179. However, undertakings should consider the adjustment for the expected default losses of these mitigating instruments, i.e. the credit risk of the instruments as well as any other risk connected to them should also be allowed for. This allowance may be omitted where the impact is not material. To assess this materiality it is necessary to take into account the relevant features, such as the period of effect of the risk mitigating instrument.

Simplification for the counterparty default adjustment

TP.2.180. Undertakings may calculate the adjustment for expected losses due to default of the counterparty, referred to in Article 81 of Directive 2009/138/EC, for a specific counterparty and homogeneous risk group to be equal as follows:

$$Adj_{CD} = -\max\left(0.5 \cdot \frac{PD}{1-PD} \cdot Dur_{mod} \cdot BE_{rec}; 0\right)$$

where :

- (a) PD denotes the probability of default of that counterparty during the following 12 months;
- (b) Dur_{mod} denotes the modified duration of the amounts recoverable from reinsurance contracts with that counterparty in relation to that homogeneous risk group;
- (c) BE_{rec} denotes the amounts recoverable from reinsurance contracts with that counterparty in relation to that homogeneous risk group.

V.2.3. Discounting

V.2.4. Calculation of technical provisions as a whole

General approach

- TP.4.1. Where future cash flows associated with insurance or reinsurance obligations can be replicated reliably using financial instruments for which a reliable market value is observable, the value of technical provisions associated with those future cash flows should be determined on the basis of the market price of those financial instruments. In this case, separate calculations of the best estimate and the risk margin should not be required.
- TP.4.2. For the purpose of determining the circumstances where some or all future cash flows associated with insurance or reinsurance obligations can be replicated reliably using financial instruments for which a reliable market value is observable, undertakings should assess whether all the criteria set out in both the following two paragraphs are met. In this case, the value of technical provisions associated with those future cash-flows should be equal to the market price of the financial instruments used in the replication.
- TP.4.3. The cash-flows of the financial instruments should replicate the uncertainty in amount and timing of the cash-flows associated with the insurance or reinsurance obligations, in relation to the risks underlying the cash-flows associated with the insurance and reinsurance obligations in all possible scenarios (i.e. the cash-flows of the financial instruments must provide not only the same expected amount as the cash-flows associated with insurance or reinsurance obligations, but also the same patterns of variability). In particular, the following cash-flows associated with insurance and reinsurance obligations cannot be reliably replicated:
- (a) cash-flows associated with insurance or reinsurance obligations that depend on the likelihood that policy holders will exercise contractual options, including lapses and surrenders;
 - (b) cash-flows associated with insurance or reinsurance obligations that depend on the level, trend, or volatility of mortality, disability, sickness and morbidity rates;
 - (c) all expenses that will be incurred in servicing insurance and reinsurance obligations.
- TP.4.4. To be used in the replications, the financial instruments should be traded in active markets, as defined in international accounting as endorsed by the Commission in accordance with Regulation (EC) N°1606/2002, which also meet all of the following criteria:
- (a) a large number of assets can be transacted without significantly affecting the price of the financial instruments used in the replications (deep),
 - (b) assets can be easily bought and sold without causing a significant movement in the price (liquid),
 - (c) current trade and price information are normally readily available to the public, in particular to the undertakings (transparent).

TP.4.5. Where under the same contract a number of future cash-flows exist, which meet all the conditions mentioned above, in order to calculate the technical provision as a whole and other future cash-flows which do not meet some of those conditions, both sets of cash-flows should be unbundled.

For the first set of cash-flows which do meet the conditions, no separate calculation of the best estimate and the risk margin should be required. However, a separate calculation should be required for the second set of cash-flows, where the required conditions are not met.

If the proposed unbundling is not feasible, for instance when there is significant interdependency between the two sets of cash flows, separate calculations of the best estimate and the risk margin should be required for the whole contract.

Concrete applications

TP.4.6. The main case where insurance or reinsurance obligations can be replicated reliably using financial instruments for which a reliable market value is observable is where the benefit cash-flows of the insurance or reinsurance obligation, according to the clauses of the contract, consist in the delivery of a portfolio of financial instruments for which a reliable market value is observable or are based only on the market value of the portfolio at the time that the benefit is paid.

TP.4.7. Residually, there could be very limited other cases where cash-flows of (re)insurance obligations can be replicated reliably. An example of such cases could be where there is a fixed benefit and the policyholder cannot lapse the contract.

TP.4.8. On the contrary, undertakings should not consider future cash-flows associated with insurance or reinsurance obligations to be reliably replicated if:

- (a) One or several features of the future cash-flow, inter alia its expected value, its volatility or any other feature, depend on risks whose specific pattern in the undertaking cannot be found in instruments actively traded in financial markets;
- (b) Current trade and price information are not normally readily available to the public, due to the fact that one or several features of the future cash-flow depend to any extent on the development of factors specific to the undertakings, such as expenses or acquisition costs;
- (c) or one or more features of the future cash-flow depend on the development of factors external to the undertaking for which there are no financial instruments for which reliable market values are observable.

Examples

Example	Have requirements in Article 77(4), second paragraph, of the Level 1 text been met?	Technical provisions shall be calculated:
The insurance undertaking shall pay the market value of an	<u>Yes</u> , but only under one condition: <ul style="list-style-type: none"> • a reliable market value for every asset 	<ul style="list-style-type: none"> • as a whole (if the condition is met).

equity portfolio or shall deliver an equity portfolio (matching an index or not) at the payment date.	<p>within the portfolio is observable.</p> <p>However there are, for example, fixed expense cash-flows associated with this contract which shall be excluded because they depend on the development of magnitudes internal to the undertaking.</p>	<p>This also applies when the contract pays the market value of the units at the earlier of maturity, death or surrender.</p> <ul style="list-style-type: none"> • Best Estimate + Risk Margin (if not and for the expense cash-flows)
Term-assurance contracts and with-profits contracts.	<p><u>No</u>: In these cases the expected value, the volatility and other features of the future cash-flows associated with insurance obligations depend on the biometric development as well as on the behaviour of the policyholder.</p>	Best Estimate + Risk Margin
Pure Unit-linked contract (without any additional guarantees) ⁷	<p><u>YES</u>: regarding to the number of units guaranteed, and</p> <p><u>No</u>: expense cash-flows associated with the fact that the contract will be managed till it ends.</p>	<p>For the calculation of the technical provision, these two aspects of the contract must be unbundled:</p> <p>As a whole;</p> <p>Best Estimate + Risk Margin (only for the expenses)⁸</p>
The insurance undertaking shall pay the market value of an over the counter (OTC) derivative or portfolio or shall deliver an OTC	<p><u>No</u>: Per definition, it is not possible to find a reliable market value for an OTC derivative.</p>	Best Estimate + Risk Margin.

⁷ According to the CEA-Groupe Consultatif Solvency II Glossary, a unit-linked contract is « a contract, under which benefits are determined based on the fair value of units of a mutual fund. The benefit reflects the fair value of a specific number of units, which is either contractually determined as a fixed number, or derived from other events under the contract, e.g. premium payments associated with a specific additional number of units based on the fair value of the units at the time of premium payment. »

⁸ The annual expense loading is generally fixed in percentage of the value of technical provisions at a certain date. The amount guaranteed to the policyholder is the market value of a number of units reduced by the expense loading. The loading is generally at such a level that it covers more than the expenses incurred, thus including future profits. The best estimate of such an obligation would be negative. However, in a stress situation, the market value of the unit can fall so low that the expense loading is no longer sufficient to cover the expenses incurred. Therefore, a capital requirement and a risk margin need to be calculated.

derivative or portfolio at the payment date.		
--	--	--

Considering the method for replication, the following examples present some cases and the corresponding treatment:

An insurance undertaking investing in assets replicating the future cash-flows provided by a third party (e.g. investment bank).	No: This case introduces counterparty and concentration risks with regard to the issuer of the replicating asset.	Best Estimate + Risk Margin
An insurance undertaking signs a contract with a reinsurer to replicate the future cash-flows.	No: a reinsurance contract is not a financial instrument.	Best Estimate + Risk Margin
An insurance undertaking investing in assets replicating the future cash-flows according to a dynamic hedging strategy.	No: the use of a dynamic hedging strategy implies that the cash-flows of the financial instruments do not always provide the same expected amount as the cash-flows associated with insurance or reinsurance obligations and the same patterns of variability.	Best Estimate + Risk Margin

V.2.5. Risk margin

TP.5.1. This chapter covers the following aspects of the risk margin calculation:

- The definition of the risk margin and the general methodology for its calculation
- The Cost-of-Capital rate to be applied in the risk margin calculations
- The level of granularity regarding the risk margin calculations
- Simplifications that may be applied in the risk margin calculations

The definition of the risk margin and the general methodology for its calculation

TP.5.2. Usually, technical provisions consist of the best estimate and the risk margin. (For the calculation of technical provisions as a whole see subsection V.2.4) The risk margin is a part of technical provisions in order to ensure that the value of technical provisions is equivalent to the amount that insurance and reinsurance undertakings would be expected to require in order to take over and meet the insurance and reinsurance obligations.

TP.5.3. The risk margin should be calculated by determining the cost of providing an amount of eligible own funds equal to the SCR necessary to support the insurance and reinsurance obligations over the lifetime thereof. The rate used in the determination of the cost of providing that amount of eligible own funds is called Cost-of-Capital rate.

TP.5.4. The calculation of the risk margin is based on the following transfer scenario:

- the whole portfolio of insurance and reinsurance obligations of the insurance or reinsurance undertaking that calculates the risk margin (original undertaking) is taken over by another insurance or reinsurance undertaking (reference undertaking);
- the transfer of insurance and reinsurance obligations includes any reinsurance contracts and arrangements with special purpose vehicles relating to these obligations;
- the reference undertaking does not have any insurance or reinsurance obligations and any own funds before the transfer takes place;
- after the transfer the reference undertaking raises eligible own funds equal to the SCR necessary to support the insurance and reinsurance obligations over the lifetime thereof;
- after the transfer the reference undertaking has assets to cover its SCR and the technical provisions net of the amounts recoverable from reinsurance contracts and special purpose vehicles;
- the assets should be considered to be selected in such a way that they minimise the SCR for market risk that the reference undertaking is exposed to;
- the SCR of the reference undertaking captures
 - underwriting risk with respect to the transferred business;
 - where it is material, the market risk referred to above, other than interest rate risk;
 - credit risk with respect to reinsurance contracts, arrangements with special purpose vehicles, intermediaries, policyholders and any other material exposures which are closely related to the insurance and reinsurance obligations;
 - operational risk;
- the loss-absorbing capacity of technical provisions in the reference undertaking corresponds for each risk to the loss-absorbing capacity of technical provisions in the original undertaking;
- there is no loss-absorbing capacity of deferred taxes for the reference undertaking;
- without prejudice to the transfer scenario, the reference undertakings will adopt future management actions that are consistent with the assumed future management actions of the original undertaking.

TP.5.5. The SCR necessary to support the insurance and reinsurance obligations over the lifetime thereof should be equal to the SCR of the reference undertaking in the scenario set out above.

TP.5.6. The calculation of the risk margin should be based on the assumption that the reference undertaking at time $t = 0$ (when the transfer takes place) will capitalise itself to the required level of eligible own funds, i.e.

$$EOF_{RU}(0) = SCR_{RU}(0),$$

where

$EOF_{RU}(0)$ = the amount of eligible own funds raised by the reference undertaking at time $t = 0$ (when the transfer takes place); and

$SCR_{RU}(0)$ = the SCR at time $t = 0$ as calculated for the reference undertaking.

The cost of providing this amount of eligible own funds equals the Cost-of-Capital rate times the amount.

TP.5.7. The assessment referred to in the previous paragraph applies to the eligible own funds to be provided by the reference undertaking in all future years.

TP.5.8. The transfer of (re)insurance obligations is assumed to take place immediately. Hence, the method for calculating the overall risk margin ($CoCM$) can in general terms be expressed in the following manner:

$$CoCM = CoC \cdot \sum_{t \geq 0} EOF_{RU}(t) / (1+r_{t+1})^{t+1} = CoC \cdot \sum_{t \geq 0} SCR_{RU}(t) / (1+r_{t+1})^{t+1},$$

where

$CoCM$ = the risk margin,

$SCR_{RU}(t)$ = the SCR for year t as calculated for the reference undertaking,

r_t = the basic risk-free rate for maturity t ; and

CoC = the Cost-of-Capital rate.

TP.5.9. The rationale for the discount factors used in the above formula can be found in Annex E.

TP.5.10. The general rules for calculating the risk margin referred to above apply to all undertakings irrespective of whether the calculation of the SCR of the (original) undertaking is based on the standard formula or an internal model.

TP.5.11. Undertakings that calculate the SCR only with the standard formula should calculate the risk margin based on the standard formula SCR.

TP.5.12. Undertakings that calculate the SCR both with the internal model and the standard formula should calculate the risk margin based on the internal model SCR.

TP.5.13. If the undertaking calculates its SCR by using the standard formula, all SCRs to be used in the risk margin calculation (i.e. all $SCR_{RU}(t)$ for $t \geq 0$) should in principle be calculated as follows:

$$SCR_{RU}(t) = BSCR_{RU}(t) + SCR_{RU,op}(t) + Adj_{RU}(t),$$

where

$BSCR_{RU}(t)$ = the Basic SCR for year t as calculated for the reference undertaking,

$SCR_{RU,op}(t)$ = the partial SCR regarding operational risk for year t as calculated for the reference undertaking; and

$Adj_{RU}(t)$ = the adjustment for the loss absorbing capacity of technical provisions for year t as calculated for the reference undertaking.

- TP.5.14. It should be ensured that the assumptions made regarding loss absorbing capacity of technical provisions to be taken into account in the SCR-calculations are consistent with the assumptions made for the overall portfolio of the original undertaking.
- TP.5.15. The Basic SCRs ($BSCR_{RU}(t)$ for all $t \geq 0$) should be calculated by using the relevant SCR-modules and sub-modules.
- TP.5.16. With respect to market risk only the immaterial market risk other than interest rate should be taken into account in the risk margin. Undertakings should follow a practicable approach when they assess the market risk. It only needs to be taken into account where it is material. For non-life insurance obligations and short-term and mid-term life insurance obligations the market risk can be considered to be nil. The assessment whether the market risk is material should take into account that it usually decreases over the lifetime of the portfolio.
- TP.5.17. With respect to non-life insurance the risk margin should be attached to the overall best estimate. No split of the risk margin between premiums provisions and provisions for claims outstanding should be made.

The Cost-of-Capital rate

- TP.5.18. The Cost-of-Capital rate is the annual rate to be applied to the capital requirement in each period. Because the assets covering the capital requirement themselves are assumed to be held in marketable securities, this rate does not account for the total return but merely for the spread over and above the risk free rate.
- TP.5.19. The Cost-of-Capital rate has been calibrated in a manner that is consistent with the assumptions made for the reference undertaking. In practice this means that the Cost-of-Capital rate should be consistent with the capitalisation of the reference undertaking that corresponds to the SCR. The Cost-of-Capital rate does not depend on the actual solvency position of the original undertaking.
- TP.5.20. The risk margin should guarantee that sufficient technical provisions for a transfer are available in all scenarios. Hence, the Cost-of-Capital rate has to be a long-term average rate, reflecting both periods of stability and periods of stress.
- TP.5.21. The Cost-of-Capital rate that should be used is **6%**.

Level of granularity in the risk margin calculations

- TP.5.22. The risk margin should be calculated per line of business. A straight forward way to determine the margin per line of business is as follows: First, the risk margin is calculated for the whole business of the undertaking, allowing for diversification between lines of business. In a second step the margin is allocated to the lines of business.

TP.5.23. The risk margin for the whole portfolio of insurance and reinsurance obligations shall be equal to the following:

$$RM = CoC \cdot \sum_{t \geq 0} \frac{SCR(t)}{(1 + r(t+1))^{t+1}}$$

where:

- (a) CoC denotes the Cost-of-Capital rate;
- (b) the sum covers all integers including zero;
- (c) SCR(t) denotes the Solvency Capital Requirement of the reference undertaking after t years;
- (d) r(t+1) denotes the basic risk-free interest rate for the maturity of t+1 years.

TP.5.24. The basic risk-free interest rate r(t+1) shall be chosen in accordance with the currency used for the financial statements of the insurance or reinsurance undertaking.

TP.5.25. Where insurance and reinsurance undertakings calculate their Solvency Capital Requirement using an approved internal model and determine that the model is appropriate to calculate the Solvency Capital Requirement for each point in time over the lifetime of the insurance and reinsurance obligations, undertakings shall use the internal model to calculate the amounts SCR(t) of the reference undertaking.

TP.5.26. Insurance and reinsurance undertakings shall allocate the risk margin for the whole portfolio of insurance and reinsurance obligations to the relevant lines of business. The allocation shall adequately reflect the contributions of the lines of business to the Solvency Capital Requirement of the reference undertaking over the lifetime of the whole portfolio of insurance and reinsurance obligations.

TP.5.27. The risk margin per line of business should take the diversification between lines of business into account. Consequently, the sum of the risk margins per line of business should be equal to the risk margin for the whole business.

TP.5.28. The contribution of a line of business can be analysed by calculating the SCR under the assumption that the undertaking's other business does not exist. Where the relative sizes of the SCRs per line of business do not materially change over the lifetime of the business, undertakings may apply the following simplified approach for the allocation:

$$COCM_{lob} = \frac{SCR_{RU,lob}(0)}{\sum_{lob} SCR_{RU,lob}(0)} \cdot COCM,$$

where

- $COCM_{lob}$ = risk margin allocated to line of business lob
- $SCR_{RU,lob}(0)$ = SCR of the reference undertaking for line of business lob at t=0
- $COCM$ = risk margin for the whole business

Where a line of business consists of obligations where the technical provisions are calculated as a whole, the formula should assign a zero risk margin to this line of business (because $SCR_{RU,lob}(0)$ of this line of business should be zero).

Simplifications for the calculation of the risk margin of the whole business

- TP.5.29. If a full projection of all future SCRs is necessary in order to capture the participating undertaking's risk profile the undertaking is expected to carry out these calculations.
- TP.5.30. Participating undertakings should consider whether or not it would be appropriate to apply a simplified valuation technique for the risk margin. As an integral part of this assessment, the undertakings should consider what kind of simplified methods method would be most appropriate for the business. The chosen method should be proportionate to the nature, scale and complexity of the risks of the business in question.
- TP.5.31. When an undertaking has decided to use a simplified method, it should consider whether the method could be used for the projections of the overall SCR or if the relevant (sub-)risks should be projected separately. In this context, the undertaking should also consider whether it should carry out the simplified projections of future SCRs individually for each future year or if it is possible to calculate all future SCRs in one step.

A hierarchy of simplifications

- TP.5.32. Based on the general principles and criteria referred to above, the following hierarchy should be used as a decision basis regarding the choice of (non-simplified and simplified) methods for projecting future SCRs:
1. Make a full calculation of all future SCRs without using simplifications.
 2. Approximate the individual risks or sub-risks within some or all modules and sub-modules to be used for the calculation of future SCRs.
 3. Approximate the whole SCR for each future year, e.g. by using a proportional approach.
 4. Estimate all future SCRs "at once", e.g. by using an approximation based on the duration approach.
 5. Approximate the risk margin by calculating it as a percentage of the best estimate.
- TP.5.33. In this hierarchy the calculations get simpler with each step.
- TP.5.34. When choosing the calculation method, it is not required that the complexity of the calculations should go beyond what is necessary in order to capture the material characteristics of the undertaking's risk profile.
- TP.5.35. The distinction between the levels in the hierarchy sketched above is not always clear-cut. This is e.g. the case for the distinction between the simplifications on level 2 and level 3. An example may be a proportional method (based on the development of the best estimate technical provisions) applied for an individual module or sub-

module relevant for the calculation of future SCRs for the reference undertaking. Such simplifications can be seen as belonging to either level 2 or level 3.

Specific simplifications

TP.5.36. The simplifications referred to in this subsection are described in the context of the standard formula. The application of simplifications for cases where the SCR is calculated with internal models should follow the general approach proposed in this paper with an appropriate case-by-case assessment.

TP.5.37. With respect to the simplifications allowing for all future SCRs to be estimated “at once” (the duration approach, level 4 in the hierarchy), it will be natural to combine the calculations of the Basic SCR and the SCR related to operational risk.

TP.5.38. Accordingly, in order to simplify the projections to be made if level 3 of the hierarchy is applied, a practical solution could be to allow projections of the future SCRs in one step, instead of making separate projections for the basic SCR, the capital charge for operational risk and the loss absorbing capacity of technical provisions, respectively.

TP.5.39. The simplifications allowed for when calculating the SCR should in general carry over to the calculation of the risk margin.

Simplifications for individual modules and sub-modules (level 2 of the hierarchy)

TP.5.40. A more sophisticated approach to the simplifications would be to focus on the individual modules or sub-modules in order to approximate the individual risks and/or sub-risks covered by the relevant modules.

TP.5.41. In practise, this would require that the participating undertaking look closer at the risks and sub-risks being relevant for the following modules:

- underwriting risk (life, health and non-life, respectively),
- counterparty default risk with respect to ceded reinsurance and SPVs, and
- market risk,

in order to investigate to what extent the calculations could be simplified or approximated.

TP.5.42. In the following paragraphs some proposals for such simplifications are put forward and the main aspects of the simplifications are briefly explained.

Life underwriting risk

TP.5.43. The simplifications allowed for the SCR-calculations in respect of mortality, longevity, disability risk, expense risk, revision risk and catastrophe risk carry over to the Cost-of-Capital calculations.

Health Underwriting Risk

TP.5.44. The simplifications applied in the life underwriting module can in general be applied also in the sub-module for SLT health underwriting risk, i.e. for health insurance obligations pursued on a similar basis as life insurance. However, some adjustment should be made regarding revision risk (inflation risk should be included), while no simplifications are proposed for health catastrophe risk.

TP.5.45. With respect to the sub-module for Non-SLT health underwriting risk, the simplifications introduced for the non-life underwriting risk (if any) should be used.

Non-life Underwriting Risk

TP.5.46. Within the context of simplifications for individual modules and sub-modules, there seems to be no obvious manner in which the formula (per se) applied for calculating the capital charges for premium and reserve risk can be simplified.

TP.5.47. However, the calculation of the future SCRs related to premium and reserve risk will be somewhat simplified due to the fact that renewals and future business are not taken into account:

- If the premium volume in year t is small compared to the reserve volume, then the premium volume for year t can be set to 0. An example may be business comprising no multiple-year contracts, where the premium volume can be set to 0 for all future years t where $t \geq 1$.
- If the premium volume is zero, then the capital charge for non-life underwriting can be approximated by the formula:

$$3 \cdot \sigma_{(res,mod)} \cdot PCO_{Net}(t),$$

where $\sigma_{(res,mod)}$ represents the aggregated standard deviation for reserve risk and $PCO_{Net}(t)$ the best estimate provision for claims outstanding net of reinsurance in year t .

TP.5.48. As a further simplification it can be assumed that the undertaking-specific estimate of the standard deviation for premium risk and reserve risk remain unchanged throughout the years.

TP.5.49. Also the underwriting risk charge for catastrophe risk should be taken into account only with respect to the insurance contracts that exist at $t = 0$.

Counterparty Default Risk

TP.5.50. The counterparty default risk charge with respect to reinsurance ceded can be calculated directly from the definition for each segment and each year. If the exposure to the default of the reinsurers does not vary considerably throughout the development years, the risk charge can be approximated by applying reinsurers' share of best estimates to the level of risk charge that is observed in year 0.

TP.5.51. According to the standard formula, counterparty default risk for reinsurance ceded is assessed for the whole portfolio instead of separate segments. If the risk of default in a segment is deemed to be similar to the total default risk or if the default risk in a segment is of negligible importance then the risk charge can be arrived at by applying reinsurers' share of best estimates to the level of the total capital charge for reinsurers' default risk in year 0.

Market Risk

TP.5.52. The contribution of the market risk to the risk margin, where it is material, may be approximated as follows:

$$\text{CoCMMkt} \approx \text{CoC} \cdot \text{UMRU}_{\geq 0}$$

where CoC is the Cost-of-Capital rate, while the approximated sum of the present and future SCRs covering the market risk ($\text{UMRU}_{\geq 0}$) is calculated as follows:

$$\text{UMRU}_{\geq 0} = \max \{0.5 \cdot \text{BENet}(0) \cdot (\text{Durmod} - n) (\text{Durmod} - n + 1) \cdot \Delta r_n; 0\}$$

where:

$\text{BENet}(0)$ = the best estimate net of reinsurance as assessed at time $t = 0$ for the undertaking's portfolio of (re)insurance liabilities;

Durmod = the modified duration of the undertaking's (re)insurance liabilities net of reinsurance at $t = 0$;

n = the longest duration of available risk-free financial instruments (or composition of instruments) to cover the (re)insurance liabilities; and

Δr_n = the absolute decrease of the risk-free interest rate for maturity n under the downward stress scenario of the interest rate risk submodule.

TP.5.53. The calculation method sketched may also be applied in the context of a proportional method (level 3 of the hierarchy) or a duration method (level 4 of the hierarchy) – given that the necessary adjustments are made in the relevant formulas.

TP.5.54. The calculation needs to be carried out separately for each currency.

TP.5.55. It is noted that in cases where the longest duration of the risk-free financial instruments is shorter than the modified duration of the insurance liabilities, the market risk may have a huge impact on the overall risk margin. In such cases the participating undertaking needs to replace the approximation described in the previous paragraphs with a more accurate simplification, e.g. by taking into account the fact that the best estimate (of technical provisions) to be applied in the calculation of market risk in general will decrease over time. Moreover, the calculations may be carried out in a manner that reflects the risk-reducing effect of technical provisions (e.g. future bonuses).

Simplifications for the overall SCR for each future year (level 3 of the hierarchy)

TP.5.56. Simplifications classified as belonging to level 3 of the hierarchical structure sketched in these specifications are based on an assumption that the future SCRs are proportional to the best estimate technical provisions for the relevant year – the proportionality factor being the ratio of the present SCR to the present best estimate technical provisions (as calculated for the reference undertaking).

TP.5.57. According to (a representative example of) the proportional method, the reference undertaking's SCR year t is fixed in the following manner:

$$\text{SCR}_{RU}(t) = \text{SCR}_{RU}(0) \cdot \text{BE}_{Net}(t) / \text{BE}_{Net}(0) \quad t = 1, 2, 3, \dots$$

where

$SCR_{RU}(0)$ = the SCR as calculated at time $t = 0$ for the reference undertaking's portfolio of (re)insurance obligations;

$BE_{Net}(0)$ = the best estimate technical provisions net of reinsurance as assessed at time $t = 0$ for the undertaking's portfolio of (re)insurance obligations; and

$BE_{Net}(t)$ = the best estimate technical provisions net of reinsurance as assessed at time t for the undertaking's portfolio of (re)insurance obligations.

TP.5.58. This simplification takes into account the maturity and the run-off pattern of the obligations net of reinsurance. However, the assumptions on which the risk profile linked to the obligations is considered unchanged over the years, are indicatively the following:

- the composition of the sub-risks in underwriting risk is the same (all underwriting risks),
- the average credit standing of reinsurers and SPVs is the same (counterparty default risk),
- the market risk in relation to the net best estimate is the same (market risk),
- the proportion of reinsurers' and SPVs' share of the obligations is the same (operational risk),
- the loss absorbing capacity of the technical provisions in relation to the net best estimate is the same (adjustment).

TP.5.59. An undertaking that intends to use this simplification, should consider to what extent the assumptions referred to above are fulfilled. If some or all of these assumptions do not hold, the undertaking should carry out a qualitative assessment of how material the deviation from the assumptions is. If the impact of the deviation is not material compared to the risk margin as a whole, then the simplification can be used. Otherwise the undertaking is encouraged to use a more sophisticated calculation method.

TP.5.60. The undertaking may also be able to apply the simplification in a piecewise manner across the years. For instance, if the business can be split into sub-lines having different maturities, then the whole run-off period of the obligations could be divided into periods of consecutive years where a proportional calculation method could be used.

TP.5.61. When using the simplification described in the previous paragraphs, some considerations should be given to the manner in which the best estimate technical provisions net of reinsurance has been calculated. In this context it should be noted that even if the applied gross-to-net techniques may lead to a reasonable figure for the best estimate net of reinsurance ($BE_{Net}(t)$) as compared to the best estimate gross of reinsurance ($BE_{Gross}(t)$) at time $t = 0$, this does not necessarily mean that all future

estimates of the best estimate net of reinsurance will be equally reliable. In such cases the simplified method sketched above may be biased.

- TP.5.62. With respect to operational risk it should be noticed that the capital charge for this risk at $t = 0$ is basically a function of the best estimate technical provisions gross of reinsurance and earned premiums gross of reinsurance, as well as annual expenses (for unit-linked business only). As a consequence, undertakings should assess to what extent the simplification based on the proportional method which assumes that the SCRs for the operational risk develop *pari passu* with the best estimate technical provisions net of reinsurance may introduce a bias in the risk margin calculations.
- TP.5.63. A similar comment concerns the scenario-based adjustments for the loss absorbing capacity of technical provisions to be taken into account when projecting the future SCRs, since it is likely to be (very) difficult to develop reliable scenarios to be applied to these projections. Accordingly, it may in practise be difficult to find other workable solutions than allowing also this component to develop in line with the best estimate technical provisions net of reinsurance. The participating undertaking should, however, make some assessments of the potential bias caused by this simplification.
- TP.5.64. A simplification similar to the one sketched in the previous paragraphs may also be applied at a more granular level, i.e. for individual modules and/or sub-modules. However, it should be noted that the number of calculations to be carried out will in general be proportional with the number of modules and/or sub-modules for which this simplification is applied. Moreover, undertakings should consider whether a more granular calculation as indicated above will lead to a more accurate estimate of the future SCRs to be used in the calculation of the risk margin.

Estimation of all future SCRs “at once” (level 4 of the hierarchy)

- TP.5.65. A representative example of a simplification belonging to level 4 of the hierarchical structure is using the modified duration of the liabilities in order to calculate the present and all future SCRs in one single step:

$$CoCM = (CoC/(1+r_1)) \cdot Dur_{mod}(0) \cdot SCR_{RU}(0),$$

where

$SCR_{RU}(0)$ = the SCR as calculated at time $t = 0$ for the reference undertaking's portfolio of (re)insurance obligations;

$Dur_{mod}(0)$ = the modified duration of reference undertaking's (re)insurance obligations net of reinsurance at $t = 0$; and

CoC = the Cost-of-Capital rate.

- TP.5.66. This simplification takes into account the maturity and the run-off pattern of the obligations net of reinsurance. However, it is based on the following simplified assumptions:

- the composition and the proportions of the risks and sub-risks do not change over the years (basic SCR),

- the average credit standing of reinsurers and SPVs remains the same over the years (counterparty default risk),
- the modified duration is the same for obligations net and gross of reinsurance (operational risk, counterparty default risk),
- the market risk in relation to the net best estimate remains the same over the years (market risk),
- the loss absorbing capacity of the technical provisions in relation to the net best estimate remains the same over the years (adjustment).

TP.5.67. An undertaking that intends to use this simplification should consider to what extent the assumptions referred to above are fulfilled. If some or all of these assumptions do not hold, the undertaking should carry out a qualitative assessment of the materiality of the deviation from the assumptions. If the impact of the deviation is not material compared to the risk margin as a whole, then the simplification can be used. Otherwise the undertaking should either adjust the formula appropriately or is encouraged to use a more sophisticated calculation.

TP.5.68. Where $SCR_{RU}(0)$ includes material sub-risks that will not exist over the whole lifetime of the portfolio, for example non-life premium risk for unexpired contracts or market risk, the calculation can often be improved by

- excluding these sub-risks from $SCR_{RU}(0)$ for the above calculation;
- calculating the contribution of these sub-risks to the risk margin separately; and
- aggregating the results (where practicable allowing for diversification).

A simple method based on percentages of the best estimate (level 5 of the hierarchy)

TP.5.69. According to this simplification the risk margin ($CoCM$) should be calculated as a percentage of the best estimate technical provisions net of reinsurance (at $t = 0$), that is

$$CoCM = \alpha_{lob} \cdot BE_{Net}(0),$$

where

$BE_{Net}(0)$ = the best estimate technical provisions net of reinsurance as assessed at time $t = 0$ for the undertaking's portfolio of (re)insurance obligations; and

α_{lob} = a fixed percentage for the given line of business.

TP.5.70. When deciding on the percentage to be used for a given line of business, the undertaking should take into account that this percentage is likely to increase if the modified duration of the insurance liabilities – or some other measure of the run-off pattern of these liabilities - increases.

TP.5.71. Undertakings should give due consideration to the very simplistic nature of this approach, and it should be used only where it has been demonstrated that none of the more sophisticated risk margin approaches in the above hierarchy can be applied.

TP.5.72. When undertakings rely on this method for the calculation of the risk margin, they will need to justify and document the rationale for the percentages used by line of business. This justification and rationale should consider any specific characteristics of the portfolios being assessed. Undertakings should not use this method when negative best estimate values exist.

Simplified calculation during the year for the risk margin

TP.5.73. The Risk Margin at a given point in time during the forthcoming year (i.e. $CoCMlob(t)$) could be calculated as follows:

$$CoCM(t) = CoCM(0) \cdot BE_{Net}(t) / BE_{Net}(0), \quad 0 < t < 1$$

where

$CoCM(0)$ = the risk margin as calculated at time $t = 0$ for the reference undertaking's portfolio of (re)insurance obligations;

$BE_{Net}(0)$ = the best estimate technical provisions net of reinsurance as assessed at time $t = 0$ for the undertaking's portfolio of (re)insurance obligations; and

$BE_{Net}(t)$ = the best estimate technical provisions net of reinsurance as assessed at time t for the undertaking's portfolio of (re)insurance obligations.

V.2.6. Proportionality

Introduction

TP.6.1. This subsection aims at providing an assessment on the way proportionality should be approached in the context of a valuation of technical provisions, to ensure that actuarial and statistical methodologies applied are proportionate to the nature, scale and complexity of the underlying risks.

Requirements for application of proportionality principle

Selection of valuation methodology

TP.6.2. Insurance and reinsurance undertakings shall use methods to calculate technical provisions which are proportionate to the nature, scale and complexity of the risks underlying their insurance and reinsurance obligations.

TP.6.3. In determining whether a method of calculating technical provisions is proportionate, insurance and reinsurance undertakings shall carry out an assessment which includes:

- a. an evaluation of the nature, scale and complexity of the risks underlying their insurance and reinsurance obligations;
- b. an evaluation in qualitative or quantitative terms of the error introduced in the results of the method due to any deviation between the following:
 - i. the assumptions underlying the method in relation to the risks;
 - ii. the results of the assessment referred to in point (a).

- TP.6.4. The assessment referred to in point (a) in paragraph TP.6.3 above shall include all risks which affect the amount, timing or value of the cash in- and out-flows required to settle the insurance and reinsurance obligations over their lifetime. For the purpose of the calculation of the risk margin, the assessment shall include all risks as referred to in TP.5.4 over the lifetime of the underlying insurance and reinsurance obligations. The assessment shall be restricted to the risks that are relevant to that part of the calculation of technical provisions to which the method is applied.
- TP.6.5. A method shall not be considered to be proportionate to the nature, scale and complexity of the risks if the error referred to in point (b) of paragraph TP.6.3 above is material, unless:
- a. no other method with a smaller error is available and the method is not likely to result in an underestimation of the amount of technical provisions; or
 - b. the method leads to an amount of technical provisions of the insurance or reinsurance undertaking higher than the amount that would result from using a proportionate method; and the method does not lead to an underestimation of the risk inherent in the insurance and reinsurance obligations that it is applied to.
- TP.6.6. 5. The error referred to in point (b) of paragraph TP.6.3 above shall be considered to be material if it leads to a misstatement of technical provisions or their components that could influence the decisions-making or judgement of the intended user of the information relating to the value of technical provisions.
- TP.6.7. The principle of proportionality requires that the (re)insurance undertaking should be allowed to choose and apply a valuation method which is:
- suitable to achieve the objective of deriving a market-consistent valuation according to the Solvency II principles (compatible with the Solvency II valuation principles); but
 - not more sophisticated than is needed in order to reach this objective (proportionate to the nature, scale and complexity of the risks).
- TP.6.8. This does however not mean that an application of the principle of proportionality is restricted to small and medium-sized undertakings, nor does it mean that size is the only relevant factor when the principle is considered. Instead, the individual risk profile should be the primary guide in assessing the need to apply the proportionality principle.

Role of simplified methods in the valuation framework

- TP.6.9. The principle of proportionality applies generally when a valuation methodology is chosen, allowing (re)insurance undertakings the flexibility to select a technique which is proportionate to the nature, scale and complexity of the underlying risks:

Assessment of proportionality in the valuation of technical provisions

Proportionality assessment – a three step process

TP.6.10. It would be appropriate for such an assessment to include the following three steps:

- Step 1: Assess the nature, scale and complexity of underlying risks;
- Step 2: Check whether valuation methodology is proportionate to risks as assessed in step 1, having regard to the degree of model error resulting from its application;
- Step 3: Back test and validate the assessments carried out in steps 1 and 2.

Step 1: Assess the nature, scale and complexity of risks

TP.6.11. In this step, (re)insurance undertakings should assess the nature, scale and complexity of the risks underlying the insurance obligations. This is intended to provide a basis for checking the appropriateness of specific valuation methods carried out in step two and should serve as a guide to identify where simplified methods are likely to be appropriate.

Which risks?

TP.6.12. The scope of risks which should be included in the analysis will depend on the purpose and context of the assessment. For the purpose of calculating technical provisions, the assessment should include all risks which materially affect (directly or indirectly) the amount or timing of cash flows required to settle the insurance and reinsurance obligations arising from the insurance contracts in the portfolio to be valued. Whereas this will generally include all insured risks, it may also include others such as inflation.

Nature and complexity

TP.6.13. Nature and complexity of risks are closely related and, for the purposes of an assessment of proportionality, could best be characterised together. Indeed, complexity could be seen as an integral part of the nature of risks, which is a broader concept.⁹

⁹ I.e. whether or not a risk is complex can be seen as a property of the risk which is part of its nature.

TP.6.14. In mathematical terms, the nature of the risks underlying the insurance contracts could be described by the probability distribution of the future cash flows arising from the contracts. This encompasses the following characteristics:

- the degree of homogeneity of the risks;
- the variety of different sub-risks or risk components of which the risk is comprised;
- the way in which these sub-risks are interrelated with one another;
- the level of certainty, i.e. the extent to which future cash flows can be predicted;¹⁰
- the nature of the occurrence or crystallisation of the risk in terms of frequency and severity;
- the type of the development of claims payments over time;
- the extent of potential policyholder loss, especially in the tail of the claims distribution.
- the type of business from which the risks originate, i.e. direct business or reinsurance business.
- the degree of dependency between different risk types, including the tail of the risk distribution; and
- the risk mitigation instruments applied, if any, and their impact on the underlying risk profile.

TP.6.15. The first three bullet points in the previous paragraph are in particular related to the complexity of risks generated by the contracts, which in general terms can be described as the quality of being intricate (i.e. of being “entwined” in such a way that it is difficult to separate them) and compounded (i.e. comprising a number of different sub-risks or characteristics).

TP.6.16. For example, in non-life insurance travel insurance business typically has relatively stable and narrow ranges for expected future claims, so would tend to be rather predictable. In contrast, credit insurance business would often be “fat tailed”, i.e. there would be the risk of occasional large (outlier) losses occurring, leading to a higher degree of complexity and uncertainty of the risks. Another example in non-life insurance is catastrophe (re)insurance covering losses from hurricanes where there is very considerable uncertainty over expected losses, i.e. how many hurricanes occur, how severe they are and whether they hit heavily insured areas.

TP.6.17. In life insurance, the nature and complexity of the risks would for example be impacted by the financial options and guarantees embedded into the contracts (such as surrender or other take-up options), particularly those with profit participation features.

TP.6.18. Undertakings should also seek to identify factors which would indicate the presence of more complex and/or less predictable risks. This would be the case, for example, where:

¹⁰ Note that this only refers to the randomness (volatility) of the future cash flows. Uncertainty which is related to the measurement of the risk (model error and parameter error) is not an intrinsic property of the risk, but dependent on the valuation methodology applied, and will be considered in step 2 of the proportionality assessment process.

- the cash-flows are highly path dependent; or
- there are significant non-linear inter-dependencies between several drivers of uncertainty; or
- the cash-flows are materially affected by the potential future management actions; or
- risks have a significant asymmetric impact on the value of the cash-flows, in particular if contracts include material embedded options and guarantees; or
- the value of options and guarantees is affected by the policyholder behaviour assumed in the model; or
- undertakings use a complex risk mitigation instrument, for example a complex non-proportional reinsurance structure; or
- a variety of covers of different nature are bundled in the contracts; or
- the terms of the contracts are complex (e.g. in terms of franchises, participations, or the in- and exclusion criteria of cover).

TP.6.19. The degree of complexity and/or uncertainty of the risks are associated with the level of calculation sophistication and/or level of expertise needed to carry out the valuation. In general, the more complex the risk, the more difficult it will be to model and predict the future cash flows required to settle the obligations arising from the insured portfolio. For example, where losses are the result of interaction of a larger number of different factors, the degree of complexity of the modelling would also be expected to increase.

Scale

TP.6.20. Assigning a scale introduces a distinction between “small” and “large” risks. Undertakings may use a measurement of scale to identify sub-risks where the use of simplified methods would likely be appropriate, provided this is also commensurate with the nature and complexity of the risks.

TP.6.21. For example, where undertakings assess that the impact of inflation risk on the overall risk profile of the portfolio is small, they may consider that an explicit recognition of inflation scenarios would not be necessary. A scale criterion may also be used, for example, where the portfolio to be measured is segmented into different sub-portfolios. In such a case, the relative scale of the individual sub-portfolios in relation to the overall portfolio could be considered.

TP.6.22. Related to this, a measurement of scale may also be used to introduce a distinction between material and non-material risks. Introducing materiality in this context would provide some undertaking-specific threshold or cut-off point below which it would be regarded as justifiable to use simplifications for certain risks.

TP.6.23. Undertakings should use an interpretation of scale which is best suited to their specific circumstances and to the risk profile of its portfolio. Nevertheless the assessment of scale should lead to an objective and reliable assessment. To measure the scale of risks, further than introducing an absolute quantification of the risks, undertakings will also need to establish a benchmark or reference volume which leads to a relative rather than an absolute assessment. In this way, risks may be considered “small” or “large” relative to the established benchmark. Such a benchmark may be defined, for example, in terms of a volume measure such as

premiums or technical provisions that serves as an approximation for the risk exposure.

Combination of the three indicators and overall assessment

TP.6.24. The three indicators - nature, scale and complexity - are strongly interrelated, and in assessing the risks the focus should be on the combination of all three factors. This overall assessment of proportionality would ideally be more qualitative than quantitative, and cannot be reduced to a simple formulaic aggregation of isolated assessments of each of the indicators.

TP.6.25. In terms of nature and complexity, the assessment should seek to identify the main qualities and characteristics of the risks, and should lead to an evaluation of the degree of their complexity and predictability. In combination with the “scale” criterion, undertakings may use such an assessment as a “filter” to decide whether the use of simplified methods would be likely to be appropriate. For this purpose, it may be helpful to broadly categorise the risks according to the two dimensions “scale” and “complexity/predictability”:

TP.6.26. An assessment of nature, scale and complexity may thus provide a useful basis for the second step of the proportionality process where it is decided whether a specific valuation methodology would be proportionate to the underlying risks.

Step 2: Assessment of the model error

TP.6.27. For the best estimate, this means that a given valuation technique should be seen as proportionate if the resulting estimate is not expected to diverge materially from the “true” best estimate which is given by the mean of the underlying risk distribution, i.e. if the model error implied by the measurement is immaterial. More generally, a given valuation technique for the technical provision should be regarded as proportionate if the resulting estimate is not expected to diverge materially from the current transfer value.

TP.6.28. Where in the valuation process several valuation methods turn out to be proportionate, undertakings would be expected to select and apply the method which is most appropriate in relation to the underlying risks.

Materiality in the context of a valuation of technical provisions

TP.6.29. In order to clarify the meaning of materiality undertakings will use the definition of materiality used in International Accounting Standards (IAS)¹¹:

“Information is material if its omission or misstatement could influence the economic decisions of users taken on the basis of the financial statements. Materiality depends on the size of the item or error judged in the particular circumstances of its omission or misstatement. Thus, materiality provides a threshold or cut-off point rather than being a primary qualitative characteristic which information must have if it is to be useful”.

TP.6.30. When determining how to address materiality, undertakings should have regard to the purpose of the work and its intended users. For a valuation of technical provisions – and more generally for a qualitative or quantitative assessment of risk for solvency purposes – this should include the supervisory authority. Undertakings may adjust their assessment of materiality to the particular situation of a quantitative assessment exercise which usually requires a lower degree of accuracy than financial and supervisory reporting.

TP.6.31. In ensuring the most appropriate level of granularity in the assessment of materiality, for the purposes of the calculation of the technical provisions, the following should be taken into account:

- a. There are different levels at which the assessment could be carried out, namely the individual homogeneous risk groups, the individual lines of business or the business of the insurer as a whole.
- b. A risk which could be immaterial with regard to the business of the insurer as a whole may still have a significant impact within a smaller segment.
- c. Technical provisions should not be analysed in isolation but any effect on own funds and thus on the total balance sheet as well as SCR should be taken into account in the assessment.

Assessment of the estimation uncertainty in the valuation

TP.6.32. Due to the uncertainty of future events, any modelling of future cash flows (implicitly or explicitly contained in the valuation methodology) will necessarily be imperfect, leading to a certain degree of inaccuracy and imprecision in the measurement (or model error). Regardless of what methods should be applied for the valuation of technical provisions, it is important that an assessment of their appropriateness should in general include an assessment of the error implicit to the calculations. Where simplified approaches are used to value technical provisions, this could potentially introduce additional uncertainty because they are generally based on some kind of simplifying assumptions regarding the risks which are modelled (e.g. independency of some risks, proportionality between different risk-factors, neglecting future development, etc.)

¹¹ Materiality is defined in the glossary of the International Accounting Standards Board’s “Framework for the Preparation and Presentation of Financial Statements”

TP.6.33. Undertakings are not required to specify the precise amount of the error, which in practice could be difficult. Hence undertakings are not required to re-calculate the value of its technical provisions using a more complex method in order to demonstrate that the difference between the result of the chosen method and the result of a more complex method is immaterial. Instead, it is sufficient if there is reasonable assurance that the error implied by the application of the chosen method (and hence the difference between those two amounts) is immaterial.

TP.6.34. Such an assessment of the error may be carried out by expert judgement or by more sophisticated approaches, for example:

- Sensitivity analysis in the framework of the applied model: this means to vary the parameters and/or the data thereby observing the range where a best estimate might be located.
- Comparison with the results of other methods: applying different methods gives insight in potential model errors. These methods would not necessarily need to be more complex.
- Descriptive statistics: in some cases the applied model allows the derivation of descriptive statistics on the estimation error contained in the estimation.¹² Such information may assist in quantitatively describing the sources of uncertainty.
- Back-testing: comparing the results of the estimation against experience may help to identify systemic deviations which are due to deficiencies in the modelling.
- Quantitative assessment scenario as benchmark.

Approach in cases where error is expected to be material

TP.6.35. Where the intended use of a valuation technique is expected to lead to a material degree of error, undertakings should, where feasible, apply a more appropriate valuation method among the alternatives available.

TP.6.36. Where it is unavoidable for undertakings to use a valuation method which leads to a material error, the undertaking should document this and consider the implications with regard to the reliability of the valuation and their overall solvency position.

TP.6.37. In particular, undertakings should assess whether material level of error is adequately addressed in the determination of the SCR and the setting of the risk margin in the technical provisions.

TP.6.38. Where the use of a valuation technique results in a material increase in the level of uncertainty associated with the best estimate liability, undertakings should include a degree of caution in the judgements needed in setting the assumptions and parameters underlying the best estimate valuation. However, this exercise of caution should not lead to a deliberate overstatement of the best estimate provision. To avoid

¹² Of course, this would not include the uncertainty arising from a misspecification of the model itself.

a double-counting of risks, the valuation of the best estimate should be free of bias and should not contain any additional margin of prudence.

V.2.6.1. Possible simplifications for life insurance

Biometric risk factors

TP.6.39. Biometric risk factors are underwriting risks covering any of the risks related to human life conditions, e.g.:

- mortality/longevity rate,
- morbidity rate,
- disability rate.

TP.6.40. The list of possible simplifications for obtaining biometric risk factors, which does not include all simplifications allowed and which could be used in combination, includes:

- neglect the expected future changes in biometrical risk factors¹³;
- assume that biometric risk factors are independent from any other variable (i.e. mortality is independent of future changes of morbidity status of policyholder);
- use cohort or period data to analyse biometric risk factors;
- apply current tables in use adjusted by a suitable multiplier function. The construction of reliable mortality, morbidity/ disability tables and the modelling of trends could be based on current (industry standard or other) tables in use, adjusted by a suitable multiplier function. Industry-wide and other public data and forecasts should provide useful benchmarks for suitable multiplier functions.

Surrender option

TP.6.41. Besides the rational or irrational behaviour of policyholders, the experience of surrenders tends to suggest that rational reasons for movements in surrender rates are:

- quality of sales advice and whether any misselling may occur, leading to earlier surrenders in excess of later surrenders;
- the economic cycle affecting policyholders' ability to pay further premiums;
- the personal circumstances of policyholders and whether they can afford premiums.

TP.6.42. A non-exhaustive list of possible simplifications for modelling surrender rates, which could be used in combination, includes:

- assume that surrenders occur independently of financial/ economic factors;

¹³ For example, this simplification could be applied to short term contracts.

- assume that surrenders occur independently of biometric factors;
- assume independency in relation to management actions;
- assume that surrenders occur independently of the undertaking specific information;
- use a table of surrender rates that are differentiated by factors such as age, time since policy inception, product type,...;
- model the surrender as a hazard process either with a non-constant or constant intensity.

TP.6.43. Some of these simplifications convert the hazard process in a deterministic function which implies independency between the surrender time and the evaluation of economic factors, which is obviously not a realistic assumption since policyholder behaviour is not static and is expected to vary as a result of changing economic environment.

TP.6.44. Other possible surrender models¹⁴ where the surrender rate SR_t for a policy at time t also depends on economic variables include the following:

- Lemay's model $SR_t = a \cdot \alpha + b \cdot \frac{FV_t}{GV_t}$
- Arctangent model $SR_t = a + b \cdot \arctan(m\Delta_t - n)$
- Parabolic model $SR_t = a + b \cdot \Delta_t \cdot |\Delta_t|$
- Exponential model $SR_t = a + b \cdot e^{\frac{m \cdot CR_t}{MR_t}}$

where a , b , m , n , are coefficients, α denotes underlying (possible time dependent) base lapse rate, FV denotes the fund/account value of the policy, GV denotes the guaranteed value of the policy, Δ equals reference market rate less crediting rate less surrender charge, CR denotes the credit rate and, MR denotes the reference market rate.

TP.6.45. The evaluation of the surrender model should be ongoing and take into account developments in the modeling of surrenders.

TP.6.46. Even after a model has been selected there is a great challenge to estimate the parameters. The policyholder behavior may change over time and the current observed surrender pattern could be a poor prediction of future behavior.

TP.6.47. For with profit contracts the surrender option and the minimum guarantees are clearly dependent. Furthermore, management actions will also have a significant impact on the surrender options that might not be easily captured in a closed formula.

Financial options and guarantees

¹⁴ Models giving surrender rates above 100 % are not relevant.

Investment guarantees

TP.6.48. The non-exhaustive list of possible simplifications for calculating the values of investment guarantees includes:

- assume non-path dependency in relation to management actions, regular premiums, cost deductions (e.g., management charges, etc.);
- use of representative deterministic assumptions of the possible outcomes for determining the intrinsic values of extra benefits;
- assume deterministic scenarios for future premiums (when applicable), mortality rates, expenses, surrender rates, etc.;
- apply formulaic simplified approach for the time values if they are not considered to be material.

Other options and guarantees

TP.6.49. The possible simplifications for other options and guarantees are:

- ignore options and guarantees which are not material;
- group, for instance, guaranteed expense charge and/or guaranteed mortality charge with investment guarantee and approximate them as one single investment guarantee;
- use the process outlined in the previous paragraph in the absence of other valuation approaches, if appropriate.

Distribution of future discretionary benefits

TP.6.50. Possible simplifications for determining the future bonuses may include, where appropriate:

- assume that economic conditions will follow a certain pattern, not necessarily stochastic, appropriately assessed;
- assume that the business mix of undertakings' portfolios will follow a certain pattern, not necessarily stochastic, appropriately assessed.

TP.6.51. The undertakings could use all or some of the simplifications proposed in the previous paragraph to determine amounts of future discretionary bonuses, or approximate the amount of available extra benefits for distribution to policyholders as the difference (or appropriate percentage of the difference) between the value of the assets currently held to back insurance liabilities of these contracts and the technical provisions for these contracts, without taking into account future discretionary bonuses.

TP.6.52. The possible simplification for distribution of extra benefits to a particular line of business (to each policy) is to assume a constant distribution rate of extra benefits.

Expenses and other charges

A) Expenses

TP.6.53. The possible simplification for expenses is to use an assumption built on simple models, using information from current and past expense loadings, to project future expense loadings, including inflation.

B) Other charges

TP.6.54. The possible simplification for other charges is to assume that:

- other charges are a constant share of extra benefits; or
- a constant charge (in relative terms) from the policy fund.

Other issues

TP.6.55. Having in mind the wide range of assumptions and features taken into account to calculate life insurance best estimates, there are other areas not mentioned previously where it might be possible to use methods meeting the requirements set out in these specifications to apply simplifications.

TP.6.56. As an example, other possible simplifications are to assume that:

- the projection period is one year and that
- cash-flows to/from the policyholders occur either at the end of the year or in the middle of the year.

TP.6.57. Another possible simplification for the payments of premiums which also include lapses and premium waivers (e.g. premium waivers in case of disability of the insured person) is to assume that future premiums are paid independently of the financial markets and undertakings' specific information. If lapses and premium waivers could not be treated as independent of financial markets or undertaking specific parameters, than lapses should be valued with similar techniques as those for surrender options or investment guarantees.

TP.6.58. As a further example, possible simplifications in relation to fund/account value projections (which is important for valuing financial options and guarantees) are to:

- group assets with similar features/use representative assets or indexes;
- assume independency between assets, for instance, between equity rate of return and interest rate.

V.2.6.2. Possible simplifications for non-life insurance

TP.6.59. Simplifications proposed in these specifications will only be applicable under the framework contained above to define the proportionality principle regarding technical provisions

Outstanding reported claim provision. First simplification

TP.6.60. Description. This simplification applies to the calculation of the best estimate of reported claims by means of considering the number of claims reported and the average cost thereof. Therefore it is a simplification applicable when it does not deliver material model error in the estimate of frequency and severity of claims, and their combination. This simplification can be used to calculate outstanding claims provision and provision for incurred but not reported claims as a whole, adding to N_i the IBNR claims calculated as N_t .

TP.6.61. Calculation. The calculation is rather straightforward:

$$\sum_i (N_i \cdot A_i - P_i)$$

where:

N_i = number of claims reported, incurred in year i

A_i = average cost of claims closed in year i

P_i = payments for claims incurred in year i

N_i and P_i are known, while A_i is determined using the average cost of claims closed in the year i , independently of the accident year, multiplying that amount by a factor to take into account future inflation and discounting.

TP.6.62. Criteria for application. Additionally to the general requirements set out in these specifications, the above method is an allowable simplification when the size of claims incurred in a year has a small variance, or the number of claims incurred in a year is big enough to allow the average cost to be representative.

TP.6.63. These two conditions are unlikely to exist in case of claims that have a medium or long term of settlement since the claim is reported.

TP.6.64. It should be noted that this method does not seem appropriate in situations where only few development years or occurrence years (for example less than 4) are available. In these cases, it is likely that the claims which are still open are the more complex ones, with higher average of expected ultimate loss. Especially for reinsurance business, this simplification is not applicable, as the necessary data are not available.

Outstanding reported claim provision. Second simplification

TP.6.65. In circumstances where (e.g. due to the nature or size of the portfolio) a lack of data for the valuation of technical provisions is unavoidable for the undertaking, insurers may have to use appropriate approximations, including case by case approaches. In such cases, further judgmental adjustments or assumptions to the data may often need to be applied in order to allow the valuation to be performed using such approximations in line with the principle of proportionality.

TP.6.66. Description. This method consists in the simple sum of estimates of each claim reported at the date of reference of the valuation. The allowance of a simplified method based on a 'case-by-case approach' should be assessed carefully, according to the features of the claims portfolio and the undertaking internal structure and capabilities.

TP.6.67. Scope. Further to the general requirements set out in these specifications, the undertaking should develop written documentation on:

- procedures applicable to assess the initial valuation of a claim when little is known about its features. Valuation must be based on the experience on the average cost of claims with similar features;
- the method to include inflation, discounting and direct expenses;
- the frequency of the valuations' review, which must be at least quarterly;
- the procedure to take into account the changes in both entity specific, legal, social, or economic environmental factors;

- the requirements in order to consider the claim to be closed.

TP.6.68. Calculation. This method should start estimating each individual provision for a single claim upon up-to-date and credible information and realistic assumptions. Furthermore:

- this estimate should take account of future inflation according to a reliable forecast of the time-pattern of the payments;
- the future inflation rates should be market consistent and suitable for each line of business and for the portfolio of the undertaking;
- individual valuations should be revised as information is improved;
- furthermore, where back testing evidences a systematic bias in the valuation, this should be offset with an appropriate adjustment, according to the experience gained with claims settlement in previous years and the expected future deviations;
- undertakings should complete the valuation resulting from this method with an IBNR and an ULAE provision.

TP.6.69. Criteria for application. Further to the general requirements set out in these specifications, this method is an allowable simplification in the case of small portfolios where the undertaking has sufficient information, but the number of claims is too small to test patterns of regularity.

TP.6.70. This method is also allowable, although as an approximation, in case of (a) high-severity-low-frequency claims, and (b) new (re)insurance company or new line of business, although only temporarily until achieving sufficient information to apply standard methods. However, where the lack of information is expected to be permanent (e.g. the case of ‘tail’ risks with a very slow process of collecting claims information), the undertaking would be required to complement the data available by making extra efforts to look for relevant external information to allow the understanding of the underlying risks and to use extensively adequate expert opinion and judgements. Documentation is also a key aspect in this subject (see these specifications regarding data quality).

Incurred but not reported claims provision. First simplification

TP.6.71. Description. This simplification applies to the calculation of the best estimate of incurred but not reported claims (IBNR) by means of an estimation of the number of claims that would be expected to be declared in the followings years and the cost thereof.

TP.6.72. Calculation. The final estimate of this technical provision is derived from the following expression, where just for illustrative purposes a three-year period of observation has been considered (the adaptation of the formula for longer series is immediate):

$$IBNR_{reserve\ year\ t} = N_t \cdot C_t,$$

where:

C_t = average cost of IBNR claims, after taking into account inflation and discounting. This cost should be based on the historical average cost of claims

reported in the relevant accident year. Since a part of the overall cost of claims comes from provisions, a correction for the possible bias should be applied.

And

$$N_t = \frac{R_t}{R_{t-1} + R_{t-2} + R_{t-3}} \cdot \left(\frac{N_{t-1}}{p_1} + \frac{N_{t-2}}{p_2} + N_{t-3} \right)$$

Furthermore, in these expressions:

N_{t-i} = number of claims incurred but not reported at the end of the year t-i, independently of the accident year (to assess the number of IBNR claims all the information known by the undertaking till the end of the year t should be included).

p_1 = percentage of IBNR claims at the end of year t-3 that have been reported during the year t-2

p_2 = percentage of IBNR claims at the end of year t-3 that have been reported during the years t-2 and t-1

R_t = claims reported in year t, independently of accident year.

R_{t-i} = claims reported in year t-i, independently of accident year.

TP.6.73. This method should be based on an appropriate number of years where reliable data are available, so as to achieve a reliable and robust calculation. The more years of experience available the better quality of the mean obtained.

Obviously, this method only applies where the incurred and reported claims provision has been valued without considering IBNR, for example it has been assessed using some of the aforementioned simplifications. Annex F provides a numerical example of this method.

Incurred but not reported claims provision. Second simplification

TP.6.74. Description. This simplification should apply only when it is not possible to reliably apply the first simplification. In this simplification, the best estimate of incurred but not reported claims (IBNR) is estimated as a percentage of the provision for reported outstanding claims.

TP.6.75. Calculation. This simplification is based on the following formula:

$$Provision_{IBNR_{LOB}} = factor_{LOB_U} * PCO_{reported_{LOB}}$$

where:

$PCO_{reported_{LOB}}$ = provision for reported claims outstanding

$factor_{LOB_U}$ = factor specific for each LOB and undertaking.

TP.6.76. Criteria for application. Further to the general requirements set out to use simplifications, this method may be applied only where it is not possible to reliably apply the first simplification due to an insufficient number of years of experience. Obviously, this method only applies where the incurred and reported claims

provision has been valued without considering IBNR, for example it has been assessed using some of the aforementioned simplifications.

Simplification for claims settlement expenses

TP.6.77. Description. This simplification estimates the provision for claims settlement expenses as a percentage of the claims provision.

TP.6.78. Calculation. This simplification is based on the following formula, applied to each line of business:

$$\text{Provision for ULAE} = R * [\text{IBNR} + a * \text{PCO}_{\text{reported}}]$$

where:

R = Simple average of R_i (e.g. over the last two exercises), and

R_i = Expenses / (gross claims + subrogations).

IBNR = provision for IBNR

$\text{PCO}_{\text{reported}}$ = provision for reported claims outstanding

a = Percentage of claim provisions

TP.6.79. Criteria for application. Further to the general requirements set out in these specifications, this method is an allowable simplification when expenses can reasonably expected to be proportional to provisions as a whole, this proportion is stable in time and the expenses distribute uniformly over the lifetime of the claims portfolio as a whole.

Simplification for premium provision

TP.6.80. The simplification to derive the best estimate for premium provision is based on an estimate of the combined ratio in the line of business in question. The following input information is required:

- estimate of the combined ratio (CR) for the line of business during the run-off period of the premium provision;
- present value of future premiums for the underlying obligations (as to the extent to which future premiums fall within the contract boundaries);
- volume measure for unearned premiums; it relates to business that has incepted at the valuation date and represents the premiums for this incepted business less the premiums that have already been earned against these contracts (determined on a pro rata temporis basis).

The best estimate is derived from the input data as follows:

$$\text{BE} = \text{CR} * \text{VM} + (\text{CR} - 1) * \text{PVFP} + \text{AER} * \text{PVFP}$$

Where:

- BE = best estimate of premium provision
- CR = estimate of combined ratio for line of business on a gross of acquisition cost basis i.e. $\text{CR} = (\text{claims} + \text{claim related expenses}) / (\text{earned premiums gross of acquisition expenses})$
- VM = volume measure for unearned premium. It relates to business that has incepted at the valuation date and represents the premiums for this incepted business less the premium that has already been earned against these contracts. This measure should be calculated gross of acquisition expenses

- PVFP= present value of future premiums (discounted using the prescribed term structure of risk-free interest rates) gross of commission
- AER = Estimate of acquisition expenses ratio for line of business

The combined ratio for an accident year (= occurrence year) is defined as the ratio of expenses and incurred claims in a given line of business or homogenous group of risks over earned premiums. The earned premiums should exclude prior year adjustment. The expenses should be those attributable to the premiums earned other than claims expenses. Incurred claims should exclude the run-off result, that is they should be the total for losses occurring in year y of the claims paid (including claims expenses) during the year and the provisions established at the end of the year.

Alternatively, if it is more practicable, the combined ratio for an accident year may be considered to be the sum of the expense ratio and the claims ratio. The expense ratio is the ratio of expenses (other than claims expenses) to written premiums, and the expenses are those attributable to the written premiums. The claims ratio for an accident year in a given line of business or homogenous group of risks should be determined as the ratio of the ultimate loss of incurred claims over earned premiums.

V.2.6.3. Possible simplifications for reinsurance recoverables

Life reinsurance

TP.6.81. For the calculation of the probability-weighted average cash-flows of the recoverables or net payments to the policyholder the same simplifications as for the calculation of best estimate of life insurance policies could be applied.

TP.6.82. The result from the calculation should be adjusted to take account of the expected losses due to the default of the counterparty.

Non-life reinsurance

TP.6.83. With respect to the principle of proportionality, undertakings may be allowed to use methods to derive the net best estimate from the gross best estimate without an explicit projection of the cash-flows underlying the amounts recoverable from reinsurance contracts.

TP.6.84. The approaches considered represent Gross-to-Net techniques, meaning that it is presupposed that an estimate of the technical provisions gross of reinsurance (compatible with the Solvency II valuation principles) is already available. Following such techniques the value of reinsurance recoverables is derived in a subsequent step as the excess of the gross over the net estimate.

TP.6.85. Finally, it should be noted that where this subsection addresses the issue of recoverables (and corresponding net valuations), this is restricted to recoverables from reinsurance contracts, and does not include consideration of recoverables from SPVs.

TP.6.86. From a practical perspective it is understood that Solvency II does not prevent methods of calculation – including simplifications – whereby the technical provisions net of reinsurance are estimated in a first step, while an estimate of the reinsurance recoverables is fixed as a residual (i.e. as the difference between the estimated technical provisions gross and net of reinsurance, respectively). Accordingly, this approach has been chosen in the following discussion of the Gross-to-Net techniques that may be applied in the context of non-life insurance.

Gross-to-net techniques

TP.6.87. A detailed analysis of the gross-to-net techniques can be found in the *Report on Proxies* elaborated by CEIOPS/Groupe Consultatif Coordination Group¹⁵ as well as the gross-to-net techniques which were tested (based on the recommendations contained in this report) in the QIS4 exercise. This description of gross-to-net techniques has been included purely for informational purposes.

Analysis

TP.6.88. This subsection includes the general high-level criteria to be followed by an (re)insurance undertaking applying gross-to-net techniques to guarantee its compatibility with the Solvency II framework.

Compatibility of Gross-to-Net Calculations with Solvency II

TP.6.89. The technical “gross-to-net” methods considered in this subsection are designed to calculate the value of net technical provisions in a direct manner, by converting best estimates of technical provisions gross of reinsurance to best estimates of technical provisions net of reinsurance. The value of the reinsurance recoverables is then given as the excess of the gross over the net valuation:

Reinsurance recoverables = gross provisions – net provisions

TP.6.90. An application of gross-to-net valuation techniques – and more broadly of any methods to derive the best estimate of technical provisions net of reinsurance– may be integrated into the Solvency II Framework by using a three-step approach as follows:

- **Step 1:** Derive the best estimate of technical provisions net of reinsurance.
- **Step 2:** Determine reinsurance recoverables as the difference between the best estimate values gross and net of reinsurance, respectively.
- **Step 3:** Assess whether this valuation of reinsurance recoverables is compatible with Solvency II.

Step 1: Derivation of technical provisions net of reinsurance

TP.6.91. The starting point for this step is a valuation of technical provisions gross of reinsurance. For non-life insurance obligations, the value of gross technical provisions would generally be split into the following components per homogeneous group of risk or (as a minimum) lines of business:

PP_{Gross} = the best estimate of premium provisions gross of reinsurance;
 PCO_{Gross} = the best estimate of claims provisions gross of reinsurance; and
RM = the risk margin.

TP.6.92. From this, a valuation of the best estimate technical provisions net of reinsurance within a given homogeneous risk group or line of business may be derived by

¹⁵ CEIOPS/Groupe Consultatif Coordination Group: “Report on Proxies”, July 2008,
http://www.ceiops.eu/media/docman/public_files/consultations/consultationpapers/Final%20Report%20on%20Proxies.pdf

applying Gross-to-Net techniques to the best estimates components referred to above.¹⁶

TP.6.93. The technical provisions net of reinsurance in the given homogeneous risk group or line of business would then exhibit the same components as the gross provisions, i.e.:

- PP_{Net} = the best estimate of premium provisions net of reinsurance;
- PCO_{Net} = the best estimate of claims provisions net of reinsurance; and
- RM = the risk margin.

Step 2: Determination of reinsurance recoverables as difference between gross and net valuations

TP.6.94. On basis of the results of step 1, the reinsurance recoverables (RR) per homogenous risk groups (or lines of business) may be calculated as follows (using the notation as introduced above):

$$RR = (PP_{Gross} - PP_{Net}) + (PCO_{Gross} - PCO_{Net})$$

TP.6.95. Note that implicitly this calculation assumes that the value of reinsurance recoverables does not need to be decomposed into best estimate and risk margin components. Moreover, it needs to be assessed whether the value of the reinsurance recoverables (RR) as calculated above need to be adjusted due to (expected) counterparty defaults.

Step 3: Assessment of compatibility of reinsurance recoverables with Solvency II

TP.6.96. In this step, it would need to be assessed whether the determination of the reinsurance recoverables in step 2 is consistent with Solvency II.

TP.6.97. In particular, this would require an analysis as to whether the issues referred to in the second and third paragraph of Article 81 of the Solvency II Framework Directive, i.e. the time difference between direct payments and recoveries and the expected losses due to counterparty risks, were taken into account.

TP.6.98. To achieve consistency with the required adjustment related to expected losses due to counterparty defaults, it would generally be necessary to integrate an analogous adjustment into the determination of net of reinsurance valuation components in step 1. Such an adjustment would need to be treated separately and would not be covered by one of the gross-to-net techniques discussed in this subsection.

The Scope of Gross-to-Net Techniques

TP.6.99. Non-life insurance undertakings would be expected to make use of Gross-to-Net methods in a flexible way, by applying them to either premium provisions or provisions for claims outstanding or to a subset of lines of business or accident (underwriting) years, having regard to e.g. the complexity of their reinsurance programmes, the availability of relevant data, the importance (significance) of the sub-portfolios in question or by using other relevant criteria.

TP.6.100. An undertaking would typically use a simplified Gross-to-Net technique, for example, when:

- the undertaking has not directly estimated the net best estimate;

¹⁶ Alternatively, the best estimates net of reinsurance may also be derived directly, e.g. on basis of triangles with net of reinsurance claims data.

- the undertaking has used a case-by-case approach for estimating the gross best estimate;
- the undertaking cannot ensure the appropriateness, completeness and accuracy of the data;
- the underlying reinsurance programme has changed.

Degree of Detail and Corresponding Principles/Criteria

TP.6.101. It seems unlikely that a Gross-to-Net simplified technique being applied to the overall portfolio of a non-life insurance undertaking would provide reliable and reasonably accurate approximations of the best estimate of technical provisions net of reinsurance.¹⁷ Accordingly, non-life insurance undertakings should, in general, carry out the Gross-to-Net calculations at a sufficiently granular level. In order to achieve this level of granularity a suitable starting point would be:

- to distinguish between homogenous risk groups or, as a minimum, lines of business;
- to distinguish between the premium provisions and provisions for claims outstanding (for a given homogenous risk group or line of business); and
- with respect to the provisions for claims outstanding, to distinguish between the accident years not finally developed and – if the necessary data is available and of sufficient quality – to distinguish further between provisions for RBNS-claims and IBNR-claims, respectively.

TP.6.102. A further refinement that may need to be applied when stipulating the Gross-to-Net techniques would be to take into account the type of reinsurance cover and especially the relevant (i.e. most important) characteristics of this cover.

TP.6.103. When applying such refinements, the following general considerations should be made:

- Whereas increasing the granularity of Gross-to-Net techniques will generally lead to a more risk-sensitive measurement, it will also increase their complexity, potentially leading to additional implementation costs for undertakings. Therefore, following the principle of proportionality, a more granular approach should only be chosen where this is necessary regarding the nature, scale and complexity of the underlying risks (and in particular the corresponding reinsurance program).
- For certain kinds of reinsurance covers (e.g. in cases where the cover extends across several lines of business, so that it is difficult to allocate the effect of the reinsurance risk mitigation to individual lines of business or even homogeneous groups of risk, or where the cover is only with respect to certain perils of a LOB), increasing the granularity of Gross-to-Net techniques as described below will not suffice to derive an adequate determination of provisions net of reinsurance. In such cases, individual approaches tailored to the specific reinsurance cover in question would need to be used.

¹⁷ A possible exception may be a monoline insurer that has kept its reinsurance programme unchanged over time.

- As an alternative to Gross-to-Net calculations, it may be contemplated to use a direct calculation of net provisions based on triangular claims data on a net basis. However, it should be noted that such a technique would generally require adjustments of the underlying data triangle in order to take into account changes in the reinsurance program over time, and therefore would generally be rather resource intensive. Also, an application of such “direct” techniques may not yield a better quality valuation than an application of more granular Gross-to-Net techniques as discussed below.

Distinguishing between premium provisions and provisions for claims outstanding

TP.6.104. For both the premium provisions and the provisions for claims outstanding it is assumed at the outset that the Gross-to-Net methods should be stipulated for the individual lines of business.

Premium provisions

TP.6.105. With respect to the premium provisions, the relationship between the provisions on a gross basis ($PP_{Gross,k}$), the provisions on a net basis ($PP_{Net,k}$) and the Gross-to-Net “factor” ($GN_k(c_k)$) – for line of business (or homogeneous risk group) no. k – can be represented in a somewhat simplified manner as follows:¹⁸

$$PP_{Net,k} = GN_k(c_k) \times PP_{Gross,k},$$

where c_k is a parameter-vector representing the relevant characteristics of the reinsurance programme covering the CBNI claims related to line of business no. k at the balance sheet day.

TP.6.106. For lines of business where premiums, claims and technical provisions are related to the underwriting year (and not the accident year), the distinction between premium provisions and provisions for claims outstanding is not clear-cut. In these cases the technical provisions related to the last underwriting year comprise both premium provisions and provisions for claims outstanding¹⁹ and the distinction between Gross-to-Net techniques for the two kinds of technical provisions makes no sense.

Provisions for claims outstanding

TP.6.107. With respect to the provisions for claims outstanding, separate Gross-to-Net techniques should be stipulated for each accident year not finally developed (for a given line of business (or homogenous risk group)). Accordingly, the relationship between the provisions on a gross basis ($PCO_{Gross,k,i}$), the provisions on a net basis ($PCO_{Net,k,i}$) and the Gross-to-Net “factor” ($GN_{k,i}(c_{k,i})$) for line of business (or homogeneous risk group) no. k and accident year no. i, can be represented in a somewhat simplified manner as follows:

$$PCO_{Net,k,i} = GN_{k,i}(c_{k,i}) \times PCO_{Gross,k,i},$$

where $c_{k,i}$ is a parameter-vector representing the relevant characteristics of the reinsurance programme for this combination of line of business and accident year.

¹⁸ For the sake of simplicity it is assumed that the Gross-to-Net techniques in question can be represented by a multiplicative factor to be applied on the gross provisions.

¹⁹ If the line of business in question contains multiyear contracts this will be the case for several of the latest underwriting years.

- TP.6.108. A rationale for introducing separate techniques for the individual development years or groups of development years may be that claims reported and settled at an early stage (after the end of the relevant accident year) in general have a claims distribution that differs from the distribution of claims reported and/or settled at a later stage. Accordingly, the impact of a given reinsurance programme (i.e. the ratio between expected claims payments on a net basis and expected claims on a gross basis) will differ between development years or groups of development years.
- TP.6.109. A rationale for introducing separate techniques for RBNS-claims and IBNR-claims may be that insurance undertakings in general will have more information regarding the RBNS-claims and should accordingly be able to stipulate the Gross-to-Net technique to be applied on the gross best estimate for RBNS-provisions in a more accurate manner. On the other hand the Gross-to-Net technique to be applied on the gross best estimate for IBNR-provisions is then likely to be stipulated in a less precise manner, especially if more sophisticated techniques are not available.
- TP.6.110. Finally, a rationale for making a split between “large” claims and “small” claims may be that the uncertainties related to expected claim amounts on a net basis for claims classified as “large” may in some (important) cases be small or even negligible compared to the uncertainties related to the corresponding claim amounts on a gross basis. However, this supposition depends (at least partially) on the thresholds for separation of “large” and “small” claims being fixed for the individual lines of business.

V.2.6.4. Possible simplifications for calculations of technical provisions during the year

- TP.6.111. The MCR needs to be calculated quarterly. This necessitates a quarterly calculation of technical provisions to derive the input values for the calculation of the MCR and to derive the OF.
- TP.6.112. The calculation of technical provisions between the annual reporting dates may give rise to practicability issues. For example, the data basis of the undertaking may not be adequate for this task. Another example are calculations which are so resource intensive that – compared to a partial recalculation – their full repetition during the year may not be in proportion with the additional information the calculation provides. In these cases, it may be appropriate to update the key variables of the calculations (like interest rates) while other variables with little influence on the results may be approximated.
- TP.6.113. In the application of the proportionality principle, insurance and reinsurance undertakings should ensure that the actuarial function takes into account the particular challenges of the quarterly calculations of technical provisions. In this context and subject to the proportionality assessment process as outlined above, the undertaking should decide on the application of simplified methods in the calculation of the risk margin during the year.

Simplified calculation during the year for the risk margin

- TP.5.74. It can be appropriate to base the simplified calculations of the risk margin to be carried out during the year on the risk margin calculated at the beginning of the year.

Since no full calculations of the SCR are carried out during the year, a possible simplification may be to fix the risk margin at a given point in time (t) during the forthcoming year (i.e. $CoCMlob(t)$) basing on the assumption that the ratio of the risk margin to the best estimate technical provisions (net of reinsurance) will stay constant during the year. The Risk Margin at a given point in time during the forthcoming year (i.e. $CoCMlob(t)$) could be calculated as follows:

$$CoCM(t) = CoCM(0) \cdot BE_{Net}(t) / BE_{Net}(0), \quad 0 < t < 1$$

where

$CoCM(0)$ = the risk margin as calculated at time $t = 0$ for the reference undertaking's portfolio of (re)insurance obligations;

$BE_{Net}(0)$ = the best estimate technical provisions net of reinsurance as assessed at time $t = 0$ for the undertaking's portfolio of (re)insurance obligations; and

$BE_{Net}(t)$ = the best estimate technical provisions net of reinsurance as assessed at time t for the undertaking's portfolio of (re)insurance obligations.

TP.6.114. It may be inappropriate to apply this formula in cases where the best estimates are expected to decrease, in relative terms to the business, e.g. in cases of negative best estimates or best estimates close to zero. Furthermore, there may be situations, such as run-off undertakings, that may deserve specific analysis.

TP.6.115. Another situation where this approach may not be appropriate is when undertaking's business is expected to strongly increase in the short term, leading to both a lower best estimate (due to allowance for profit at inception) and a higher duration of the obligations: in this case, in fact, this simplification leads to a lower risk margin, while an increased risk margin would be expected due to the increased duration of the liabilities.

TP.6.116. Moreover, the assumption of stability of the SCR to the best estimate over time could not be met if the undertaking has commuted a reinsurance treaty or when a purchase of a book of business causes a change in the proportional split.

TP.6.117. Accordingly, in cases where the above simplification is not appropriate, it may be a better approximation to let the risk margin stay unchanged during the year (i.e. $CoCM(t) = CoCM(0)$).

TP.6.118. A combination of the two approaches described above is also possible, e.g. by fixing the risk margin at the beginning of the year as a floor for the risk margin to be used during the year, that is:

$$CoCM(t) = \max\{(CoCM(0)/BE_{Net}(0)) \cdot BE_{Net}(t); CoCM(0)\}.$$

TP.6.119. In some circumstances, it may be unavoidable for the undertaking to apply a valuation method which leads to an increased level of estimation uncertainty in the valuation. This could e.g. be the case where there is only insufficient pertinent past

experience data available to derive or validate assumptions or in case of portfolios with high-severity-low-frequency claims.

Computation of the best estimate for life and non-life quarterly technical provisions

TP.6.120. For the quarterly calculation of the best-estimate of technical provisions, insurance and reinsurance undertakings can perform a roll-forward calculation, taking into account the cash-flows that have occurred during the quarter and the new obligations arising during the quarter. The undertaking should update assumptions of the roll-forward calculation method when the actual versus expected analysis indicates that significant changes have occurred during the quarter.

Computation of the best estimate for life quarterly technical provisions

TP.6.121. For the quarterly calculation of the best-estimate of life technical provisions for index-linked, unit-linked, with-profit contracts or contracts with financial guarantees, insurance and reinsurance undertakings should assess the sensitivity of the best estimate to the relevant financial parameters. They should document the choice of the set of financial parameters and their on-going adequacy to their portfolio of assets, as well as the relevance and the accuracy of the method used for the sensitivity analysis..

SECTION 2 – SCR – STANDARD FORMULA

SCR.1. Overall structure of the SCR

SCR.1.1. SCR General remarks

Overview

SCR.1.1. The calculation of the Solvency Capital Requirement (SCR) according to the standard formula is divided into modules as follows:

SCR.1.2. For each module and sub-module, the specifications are split into the following subsections:

- Description: this defines the scope of the module, and gives a definition of the relevant sub-risk;
- Input: this lists the input data requirements;
- Output: this describes the output data generated by the module;
- Calculation: this sets out how the output is derived from the input;
- Simplification: this sets out how the calculation can be simplified under certain conditions. (This subsection is only included where simplified calculations are envisaged.)

Technical provisions in the SCR standard formula calculations

SCR.1.3. For the purposes of the SCR standard formula calculation, technical provisions should be valued in accordance with the specifications laid out in the section on valuation. To avoid circularity in the calculation, any reference to technical provisions within the calculations for the individual SCR modules is to be understood to exclude the risk margin.

Scope of underwriting risk modules

SCR.1.4. The SCR standard formula includes three modules for underwriting risk: the life, the health and the non-life underwriting risk module. The scope of the modules is defined as follows:

- The life underwriting risk module captures the risk of life (re)insurance obligations other than health (re)insurance obligations.
- The health underwriting risk module captures the risk of health (re)insurance obligations.
- The non-life underwriting risk module captures the risk of non-life (re)insurance obligations other than health (re)insurance obligations.

For the purpose of this distinction the definition of life, health and non-life insurance obligations set out in subsection V.2.1 on segmentation applies. In particular, annuities stemming from non-life insurance contracts are either in the scope of the health underwriting module (if the underlying contract is Non-SLT health insurance) or in the scope of the life underwriting module.

Scenario-based calculations

SCR.1.5. For several sub-modules the calculation of the capital requirement is scenario-based: The capital requirement is determined as the impact of a specified scenario on the level of Basic Own Funds(*BOF*).

SCR.1.6. The level of Basic Own Funds is defined as the difference between assets and liabilities. The liabilities should not include subordinated liabilities.²⁰ The change of *BOF* resulting from the scenario is referred to as ΔBOF . ΔBOF is defined to be **positive** where the scenario results in a **loss** of *BOF*.

SCR.1.7. The scenario should be interpreted in the following manner:

- The recalculation of technical provisions to determine the change in *BOF* should allow for any relevant adverse changes in option take-up behaviour of policyholders under the scenario.
- Where risk mitigation techniques meet the requirements set out in subsections SCR.11, SCR.12 and SCR.13, their risk-mitigating effect should be taken into account in the analysis of the scenario.
- Where the scenario results in an increase of *BOF*, and therefore does not reflect a risk for the undertaking, this should not lead to a "negative capital requirement". The corresponding capital requirement in such a situation is nil.

SCR.1.8. Future management actions should be taken into account in the scenario calculations in the following manner:

- To the extent that the scenario stress under consideration is considered to be an instantaneous stress, no management actions may be assumed to occur during the stress.
- However it may be necessary to reassess the value of the technical provisions after the stress. Assumptions about future management actions may be taken into account at this stage. The approach taken for the recalculation of the best estimate to assess the impact of the stress should be consistent with the approach taken in the initial valuation of the best estimate.
- Any assumptions regarding future management actions for the assessment of the standard formula SCR should be objective, realistic and verifiable. Guidance on these requirements can be found in subsection V.2.2.

Calibration

SCR.1.9. The SCR should correspond to the Value-at-Risk of the basic own funds of an insurance or reinsurance undertaking subject to a confidence level of 99.5% over a one-year period. The parameters and assumptions used for the calculation of the SCR reflect this calibration objective.

SCR.1.10. To ensure that the different modules of the standard formula are calibrated in a consistent manner, this calibration objective applies to each individual risk module.

SCR.1.11. For the aggregation of the individual risk modules to an overall SCR, linear correlation techniques are applied. The setting of the correlation coefficients is

²⁰ *BOF* = assets – liabilities whereby subordinated liabilities are excluded from liabilities. (Cf. Article 101(3) of the Solvency II Framework Directive where it is specified that the SCR corresponds to the Value-at-Risk of basic own funds.)

intended to reflect potential dependencies in the tail of the distributions, as well as the stability of any correlation assumptions under stress conditions.

Treatment of new business in the standard formula

SCR.1.12. The SCR should cover the risk of existing business as well as the new business expected to be written over the following 12 months.

SCR.1.13. In the standard formula, new non-life insurance and Non-SLT health insurance business is taken into account in the premium risk part of the premium and reserve risk sub-modules. The volume measure for this risk component is based on the expected premiums earned and written during the following twelve months. The sub-modules thereby allow for unexpected losses stemming from this business. However, the standard formula does not take into account the expected profit or loss of this business.

SCR.1.14. For life insurance and SLT health insurance the calculation of underwriting risk in the standard formula is based on scenarios. The scenarios consist of an instantaneous stress that occurs at the valuation date and the capital requirements are the immediate loss of basic own funds resulting from the stresses. The scenarios do not take into account the changes in assets and liabilities over the 12 months following the scenario stresses. Therefore these capital requirements do not take into account the expected profit or loss of the business written during the following 12 months.

Proportionality and simplifications

SCR.1.15. The principle of proportionality is intended to support the consistent application of the principles-based solvency requirements to all insurers.

SCR.1.16. In principle, Solvency II provides a range of methods to calculate the SCR which allows undertakings to choose a method that is proportionate to the nature, scale and complexity of the risk that are measured:

- full internal model
- standard formula and partial internal model
- standard formula with undertaking-specific parameters (not to be considered for the qualitative assessment)
- standard formula
- simplifications

SCR.1.17. Undertakings may apply to several parts of the standard formula calculation specified simplifications, provided that the simplified calculation is proportionate to the nature, scale and complexity of the risks.

SCR.1.18. In assessing whether a simplified calculation could be considered proportionate to the underlying risks, the insurer should have regard to the following steps:

Step 1: Assessment of nature, scale and complexity

SCR.1.19. The insurer should assess the nature, scale and complexity of the risks. This is intended to provide a basis for checking the appropriateness of specific simplifications carried out in the subsequent step.

Step 2: Assessment of the model error

SCR.1.20. In this step the insurer should assess whether a specific simplification can be regarded as proportionate to the nature, scale and complexity of the risks analysed in the first step.

SCR.1.21. Where simplified approaches are used to calculate the SCR, this could introduce additional estimation uncertainty (or model error). The higher the estimation uncertainty, the more difficult it will be for the insurer to rely on the estimation and to ensure that it is suitable to achieve the calibration objective of the SCR.

SCR.1.22. Therefore the insurer should assess the model error that results from the use of a given simplification, having regard to the nature, scale and complexity of the underlying risks. The error should be identified by evaluating (in quantitative or qualitative terms) the deviation between the nature, scale and complexity of the risk, and the assumptions underlying the simplified calculation. A simplified calculation should not be considered to be proportionate if the error is material, unless the simplified calculation leads to a Solvency Capital Requirement which exceeds the Solvency Capital Requirement that results from the standard calculation. The error should be considered to be material if it leads to a misstatement of the Solvency Capital Requirement that could influence the decisions-making or the judgement of the user of the information relating to the Solvency Capital Requirement.

SCR.1.23. Undertaking are not required to quantify the degree of model error in quantitative terms, or to re-calculate the value of the capital requirement using a more accurate method in order to demonstrate that the difference between the result of the chosen method and the result of a more accurate method is immaterial. Instead, it is sufficient if there is reasonable assurance that the model error included in the simplification is immaterial.

SCR.1.2. SCR Calculation Structure

Overall SCR calculation

Description

SCR.1.24. The SCR is the end result of the standard formula calculation.

Input

SCR.1.25. The following input information is required:

BSCR = Basic Solvency Capital Requirement

SCR_{op} = The capital requirement for operational risk

Adj = Adjustment for the risk absorbing effect of technical provisions and deferred taxes

Output

SCR.1.26. This module delivers the following output information:

SCR = The overall standard formula capital requirement

Calculation

SCR.1.27. The SCR is determined as follows:

$$SCR = BSCR + Adj + SCR_{Op}$$

Description

SCR.1.28. The Basic Solvency Capital Requirement (BSCR) is the Solvency Capital Requirement before any adjustments, combining capital requirements for six major risk categories.

Input

SCR.1.29. The following input information is required:

SCR_{mkt} = Capital requirement for market risk

SCR_{def} = Capital requirement for counterparty default risk

SCR_{life} = Capital requirement for life underwriting risk

SCR_{nl} Capital requirement for non-life underwriting risk

SCR_{health} Capital requirement for health underwriting risk

$SCR_{intangibles}$ Capital requirement for intangible assets risk

Output

SCR.1.30. The module delivers the following output:

$BSCR$ = Basic Solvency Capital Requirement

Calculation

SCR.1.31. The BSCR is determined as follows:

$$BSCR = \sqrt{\sum_{ij} Corr_{ij} \times SCR_i \times SCR_j} + SCR_{intangible}$$

where

$Corr_{i,j}$ = the entries of the correlation matrix $Corr$

SCR_i, SCR_j = Capital requirements for the individual SCR risks according to the rows and columns of the correlation matrix $Corr$.

$SCR_{intangible}$ = the capital requirement for intangible asset risk calculated in accordance with SCR.4

SCR.1.32. The factor $Corr_{i,j}$ denotes the item set out in row i and in column j of the following correlation matrix $Corr$:

i \ j	Market	Default	Life	Health	Non-life
Market	1				
Default	0.25	1			
Life	0.25	0.25	1		
Health	0.25	0.25	0.25	1	
Non-life	0.25	0.5	0	0	1

SCR.2. Loss absorbing capacity of technical provisions and deferred taxes

SCR.2.1. Definition of future discretionary benefits

SCR.2.1. For the definition of future discretionary benefits see subsection V.2.2

SCR.2.2. Gross and net SCR calculations

SCR.2.2. The solvency capital requirement for each risk should be derived under a gross and a net calculation.

SCR.2.3. The gross calculation should be used to determine the Basic Solvency Capital Requirement and in the calculation of the adjustment for the loss-absorbing capacity of technical provisions. In the calculation of the adjustment, the result of the gross calculation is used to prevent double counting of risk mitigating effects in the modular approach. Moreover it is an additional source of information about the risk profile of the undertaking. The gross calculation does not reflect all aspects of the economic reality as it ignores the risk-mitigating effect of future discretionary benefits.

SCR.2.4. When calculating  gross Basic Solvency Capital Requirement insurance and reinsurance undertakings should base the calculation on the following requirements:

- the value of cash flows related to future discretionary benefits remains unchanged under the relevant scenario,
- where the relevant scenario affects the risk free interest rate term structure (especially the stress on the interest rate level) only the cash flows relating to guaranteed benefits should be rediscounted. The cash flows relating to future discretionary benefits should be discounted using the risk free interest rate term structure.

SCR.2.3. Calculation of the adjustment for loss absorbency of technical provisions and deferred taxes

SCR.2.5. The calculation of the adjustment for the loss-absorbing capacity  technical provisions and deferred taxes should ensure that there is no double counting of the risk mitigating effect provided by future discretionary benefits or deferred taxes.

SCR.2.6. Future discretionary benefits are usually a feature associated with life and SLT health insurance contracts. Therefore, the adjustment for the loss-absorbing capacity of technical provisions should take into account the mitigating effect provided by future discretionary benefits in relation to life underwriting risk, SLT health underwriting risk, health catastrophe risk, market risk and counterparty default risk.

In order to limit the complexity of the standard formula and the calculation burden for insurance and reinsurance undertakings the adjustment should not apply to the risks of non-life insurance and NSLT health insurance. As losses arising from inadequate or failed internal processes, personal or systems, or from external events might not be effectively absorbed by future discretionary benefits, the adjustment should not apply to operational risk.

SCR.2.7. A modular approach for the calculation of the adjustment for the loss-absorbing capacity of technical provisions and deferred taxes should be used.

SCR.2.8. The adjustment for the loss-absorbing capacity of technical provisions and deferred taxes is split into two parts as follows:

$$Adj = Adj_{TP} + Adj_{DT}$$

where

Adj_{TP} = adjustment for loss-absorbing capacity of technical provisions

Adj_{DT} = adjustment for loss-absorbing capacity of deferred taxes

SCR.2.9. The adjustment for loss-absorbing capacity of technical provisions and deferred taxes should not be positive.

Adjustment for loss-absorbing capacity of technical provisions

SCR.2.10. The solvency capital requirement for each risk should be calculated both gross and net of the loss-absorbing capacity of technical provisions.

SCR.2.11. The Basic Solvency Capital Requirement ($BSCR$) should be calculated by aggregating the gross capital requirements (for example Mkt_{int}) using the relevant correlation matrices.

SCR.2.12. The net Basic Solvency Capital Requirement ($nBSCR$) should be calculated by aggregating the net capital requirements (for example $nMkt_{int}$) using again the relevant correlation matrices.

SCR.2.13. The adjustment to the Basic SCR for the loss-absorbing capacity of technical provisions should then be determined by comparing $BSCR$ with $nBSCR$. The absolute amount of the adjustment should not exceed the total value of the technical provisions without risk margin in relation to future discretionary benefits:

$$Adj_{TP} = -\max(\min(BSCR - nBSCR; FDB); 0)$$

The net Basic Solvency Capital Requirement shall be calculated in accordance with section SCR.2.2. with the following modifications:

- (a) where the calculation of a module or sub-module of the Basic Solvency Capital Requirement is based on the impact of a scenario on the basic own funds of

insurance and reinsurance undertakings, the scenario can change the value of deferred tax assets and liabilities;

- (b) the scenario based calculations of the life underwriting risk module, the SLT health underwriting risk sub-module, the health catastrophe risk sub-module, the market risk module and the counterparty default risk module as well as the scenario-based calculation set out in points (c) and (d) shall take into account the impact of the scenario on future discretionary benefits included in technical provisions; this shall be done on the basis of assumptions on future management actions that comply with the relevant sections on valuation of technical provisions TP.2.109-TP.2.116 and TP.2.135-TP.2.143.
- (c) instead of the capital requirement for counterparty default risk on type 1 exposures, the calculation shall be based on the capital requirement that is equal to the loss in basic own funds that would result from an instantaneous loss, due to default events relating to type 1 exposures, of the amount of the capital requirement for counterparty default risk on type 1 exposures;
- (d) where insurance and reinsurance undertakings use a simplified calculation for a specific capital requirement, the undertakings shall base the calculation on the capital requirement that is equal to the loss in basic own funds that would result from an instantaneous loss of the amount of the capital and shall assume that the instantaneous loss is due to the risk that the capital requirement captures;

For the purpose of point (b) above, insurance and reinsurance undertakings shall take into account any legal, regulatory or contractual restrictions in the distribution of future discretionary benefits.

SCR.2.14. The calculation of the gross Basic Solvency Capital Requirement within a (sub-) module can also be based on the net Basis Solvency Capital Requirement. For this purpose undertakings should carry out the following steps:

- i. Calculate a stressed Solvency II balance sheet under the scenario in the (sub-) module concerned.
 - i. Determine the difference between the best estimate value of the technical provisions relating only to future discretionary benefits derived from the unstressed balance sheet that was used to calculate own funds and the corresponding value of future discretionary benefits from the stressed Solvency II balance sheet. Add this difference to the net Basic Solvency Capital Requirement.

Adjustment for the loss-absorbing capacity of deferred taxes

SCR.2.15. The adjustment for the loss-absorbing capacity of deferred taxes should be equal to the change in the value of deferred taxes of undertakings that would result from an instantaneous loss of an amount that is equal to the following amount:

$$SCR_{shock} = BSCR + Adj_{TP} + SCR_{Op}$$

where $BSCR$ is the Basic SCR, Adj_{TP} is the adjustment for the loss-absorbing capacity of technical provisions and SCR_{Op} denotes the capital requirement for operational risk.

- SCR.2.16. For the purpose of this calculation, the value of deferred taxes should be calculated as set out in the section on valuation. Where a loss of the *SCRshock* would result in the increase of deferred tax assets, insurance and reinsurance undertakings should take into account the magnitude of the loss and its impact on the undertaking's current and future financial situation when assessing whether it is probable that future taxable profits will be available against which the deferred tax asset can be utilized in accordance with the section on valuation.
- SCR.2.17. For the purpose of this calculation, a decrease in deferred tax liabilities or an increase in deferred tax assets should result in a negative *adjustment* for the loss-absorbing capacity of deferred taxes.
- SCR.2.18. Where the calculation of the adjustment results in a positive change of deferred taxes, the adjustment shall be nil.
- SCR.2.19. Undertakings should calculate the adjustment for deferred taxes in accordance with the valuation principles as set out in the section on valuation. Those principles require the calculation of the adjustment for the loss-absorbency capacity of deferred taxes by stressing the Solvency II balance sheet and determining the consequences on the undertaking's tax figures. The deferred tax adjustment should then be calculated on the basis of temporary differences between the stressed Solvency II values and the corresponding figures for tax purposes. Following the principles set out in the section on valuation, deferred taxes should be recognized in relation to all assets and liabilities that are recognized either for Solvency or tax purposes. Items not recognized for Solvency or tax purposes should be valued at zero.
- SCR.2.20. If undertakings do not set up a stressed Solvency II balance sheet, a calculation with methods based on average tax rates can be considered appropriate as well, if undertakings demonstrate that this approach avoids material misstatement of the adjustment.
- SCR.2.21. Undertakings should ensure that the calculation of the loss-absorbing capacity of deferred taxes is performed at a level of granularity that reflects all material relevant regulations of all applicable tax regimes.
- SCR.2.22. Where it is necessary to allocate the loss *SCRshock* to its causes in order to calculate the adjustment for the loss-absorbing capacity of deferred taxes, undertakings should allocate the loss to the risks that are captured by the Basic Solvency Capital Requirement and the capital requirement for operational risk. The allocation should be consistent with the contribution of the modules and sub-modules of the standard formula to the Basic SCR. The level of granularity of loss-allocation should be sufficient to allow for all material relevant regulations of applicable tax regimes to be taken into account.

Adjustment for loss absorbency of notional deferred taxes: Recognition

- SCR.2.23. Insurance and reinsurance undertakings shall recognise and value deferred taxes in relation to all assets and liabilities, including technical provisions, that are recognised for solvency or tax purposes in conformity with international accounting standards adopted by the Commission in accordance with Regulation (EC) No 1606/2002.
- SCR.2.24. Insurance and reinsurance undertakings shall value deferred taxes, other than deferred tax assets arising from the carryforward of unused tax credits and the carryforward of unused tax losses, on the basis of the difference between the values ascribed to assets and liabilities recognised and valued in accordance with Article 75 of Directive 2009/138/EC and in the case of technical provisions in accordance with Articles 76 to 85 of that Directive and the values ascribed to assets and liabilities as recognised and valued for tax purposes.
- SCR.2.25. Insurance and reinsurance undertaking shall only ascribe a positive value to deferred tax assets where it is probable that future taxable profit will be available against which the deferred tax asset can be utilised, taking into account any legal or regulatory requirements on the time limits relating to the carryforward of unused tax losses or the carryforward of unused tax credits.
- SCR.2.26. Undertakings should recognize notional deferred tax assets conditional on their temporary nature. The recognition should be based on the extent to which offsetting is permitted according to the relevant tax regimes, which may include offset against past tax liabilities, or current or likely future tax liabilities.
- SCR.2.27. Where an approach based on average tax rates is employed, undertakings should ensure that deferred tax liabilities in the unstressed Solvency II balance sheet are not double counted for the purpose of recognition. They can either support recognition of deferred tax assets in the unstressed Solvency II balance sheet, or additional deferred tax assets in the SCR calculation, but not both. Hence, the recognition of notional deferred tax assets cannot be supported by deferred tax liabilities which are already supporting the recognition of deferred tax assets in the balance sheet for valuation purposes.
- SCR.2.28. These restrictions should be implicit if a stressed Solvency II balance sheet is set up. The recognition of deferred tax assets in a stressed Solvency II balance sheet should follow the principles set out in the section on Valuation of assets and liabilities other than TP.
- SCR.2.29. Appropriate techniques should be employed to assess the temporary nature of the deferred tax asset and the timing of future taxable profits. The assessment should be undertaken in accordance with the section on valuation of assets and liabilities other than TP. Projections should take into account the prospects of the undertaking after suffering the instantaneous loss.
- SCR.2.30. Where an approach based on average tax rates is employed, undertakings should take care that notional tax assets arising from the instantaneous loss cannot be supported by future taxable profits already supporting the recognition of deferred tax assets for valuation purposes.

SCR.2.31. To avoid double counting, future profits for the recognition of deferred tax assets in the Solvency II balance sheet should be deducted from the post-stress projections of future profits. Only the remaining amount may be recognized to demonstrate eligibility of the notional deferred tax asset.

SCR.2.32. Where the undertaking has entered into contractual agreements regarding the transfer of profit or loss to another undertaking or is bound by other arrangements under existing tax legislation in the member state, the undertaking's calculation of the adjustment for loss-absorbing capacity of deferred taxes should take these agreements or arrangements into account. Where it is contractually agreed and probable that loss will be transferred to a third party ("receiving undertaking") after the undertaking ("transferring undertaking") suffers the instantaneous loss, the related deferred tax adjustment should not be recognized by the transferring undertaking except so far as payment or other benefit will be received in exchange for the transfer of notional tax losses. Payments or benefits receivable should only be recognized to the extent that a deferred tax adjustment could be recognized in accordance with SCR.2.28. if the loss was not transferred. Payment of benefits receivable should only be recognized if the contractual or legal arrangement is legally effective and enforceable by the transferring undertaking with respect to the transfer of those items. If the value of payment or benefits receivable is conditional on the SCR or tax position of the receiving undertaking, the valuation of the payment of benefits receivable should be based on a reliable estimate of the value that is expected to be received in exchange for loss transferred. The transferring undertaking should verify that the receiving undertaking is able to honor its obligations in stressed circumstances, especially after suffering the SCR stress. Any tax payable on the payment or benefit received by the transferring undertaking should be reflected in the amount of notional deferred taxes which it recognizes.

SCR.3. SCR Operational risk

Description

SCR.3.1. Operational risk is the risk of loss arising from inadequate or failed internal processes, or from personnel and systems, or from external events. Operational risk should include legal risks, and exclude risks arising from strategic decisions, as well as reputation risks. The operational risk module is designed to address operational risks to the extent that these have not been explicitly covered in other risk modules.

SCR.3.2. For the purpose of this section, reference to technical provisions is to be understood as technical provisions excluding the risk margin, to avoid circularity issues and shall be calculated without deduction of recoverables from reinsurance contracts and special purpose vehicles.

Input

SCR.3.3. The inputs for this module are:

$pEarn_{life}$	=	Earned premium during the 12 months prior to the previous 12 months for life insurance obligations, without deducting premium ceded to reinsurance
$pEarn_{life-ul}$	=	Earned premium during the 12 months prior to the previous 12 months for life insurance obligations where the investment risk is borne by the policyholders, without deducting premium ceded to reinsurance
$pEarn_{non-life}$	=	Earned premium during the 12 months prior to the previous 12 months for non-life insurance obligations, without deducting premium ceded to reinsurance
$Earn_{life}$	=	Earned premium during the previous 12 months for life insurance obligations, without deducting premium ceded to reinsurance
$Earn_{life-ul}$	=	Earned premium during the previous 12 months for life insurance obligations where the investment risk is borne by the policyholders without deducting premium ceded to reinsurance
$Earn_{nl}$	=	Earned premium during the previous 12 months for non-life insurance obligations, without deducting premiums ceded to reinsurance
TP_{life}	=	Life insurance obligations. For the purpose of this calculation, technical provisions should not include the risk margin, should be without deduction of recoverables from reinsurance contracts and special purpose vehicles
$TP_{life-ul}$	=	Life insurance obligations for life insurance policies where the investment risk is borne by the policyholders. For the purpose of this calculation, technical provisions should not include the risk margin and should be without deduction of recoverables from reinsurance contracts and special purpose vehicles
TP_{nl}	=	Total non-life insurance obligations excluding obligations under non-life contracts which are similar to life obligations, including annuities. For the purpose of this calculation, technical provisions should not include the risk margin and should be without deduction of recoverables from reinsurance contracts and special purpose vehicles
Exp_{ul}	=	Amount of expenses incurred during the previous 12 months in respect of life insurance where the investment risk is borne by the policyholders, excluding acquisition expenses.
$BSCR$	=	Basic SCR

SCR.3.4. In all the aforementioned input, life insurance and non-life insurance obligations should be defined in the same way as that set out in subsection V.2.1 on segmentation.

Output

SCR.3.5. This module delivers the following output information:

$$SCR_{Op} = \text{Capital requirement for operational risk}$$

Calculation

SCR.3.6. The capital requirement for operational risk is determined as follows:

$$SCR_{Op} = \min(0.3 \cdot BSCR; Op) + 0.25 \cdot Exp_{ul}$$

where

Op = Basic operational risk charge for all business other than life insurance where the investment risk is borne by the policyholders

is determined as follows:

$$Op = \max (Op_{premiums} ; Op_{provisions})$$

where

$$\begin{aligned} Op_{premiums} = & 0.04 \cdot (Earn_{life} - Earn_{life-ul}) + 0.03 \cdot Earn_{nonlife} \\ & + 0.04 \cdot \max(0, Earn_{life} - Earn_{life-ul} - 1.2 \cdot (pEarn_{life} - pEarn_{life-ul})) \\ & + 0.03 \cdot \max(0, Earn_{nonlife} - 1.2 \cdot pEarn_{nonlife}) \end{aligned}$$

and:

$$Op_{provisions} = 0.0045 \cdot \max(0, TP_{life} - TP_{life-ul}) + 0.03 \cdot \max(0, TP_{non-life})$$

SCR.4. SCR Intangible asset risk module

Description

SCR.4.1. Where intangible assets are recognised according to the specifications set out in subsection V.1 (see table in subsection V.1.4), the risks inherent to these items should be considered in the calculation of the SCR.

SCR.4.2. Intangible assets are exposed to two risks:

- Market risks, as for other balance sheet items, derived from the decrease of prices in the active market, and also from unexpected lack of liquidity of the relevant active market, that may result in an additional impact on prices, even impeding any transaction.
- Internal risks, inherent to the specific nature of these elements (e.g. linked to either failures or unfavourable deviations in the process of finalization of the intangible asset, or any other features in such a manner that future benefits are no longer expected from the intangible asset or its amount is reduced; risks linked to the commercialization of the intangible asset, triggered by a deterioration of the public image of the undertaking).

Input

SCR.4.3. The input for this module is:

IA = value of intangible assets according to subsection V.1

Output

SCR.4.4. The output for this module is the capital requirement for intangible assets, denoted as $SCR_{intangible}$

Calculation

$$SCR_{intangible} = 0.8 \cdot IA$$

SCR.5. SCR market risk module

SCR.5.1.Introduction

Description

SCR.5.1. Market risk arises from the level or volatility of market prices of financial instruments. Exposure to market risk is measured by the impact of movements in the level of financial variables such as stock prices, interest rates, immovable property prices and exchange rates.

SCR.5.2. Undertakings should calculate the capital requirement for market risk separately:

The effect of all market and counterparty risk scenarios should be properly reflected in the post-shock value of employees' benefits. For this purpose, the nature of the benefits themselves, and, where relevant, the nature of all contractual arrangements with an IORP or another insurance or reinsurance undertaking for the provision of these benefits, should be taken into account.

If an investment is subject to additional funding calls in the event of losses being incurred, these should be taken into account in the market risk calculations.

The capital requirement for securities lending arrangements and securities repurchase arrangements should follow the recognition of items exchanged in the Solvency II balance sheet, also taking into account contractual terms and risks stemming from the agreement.

If a lent asset remains in the balance sheet, and the asset received is not recognized, the relevant market risk charges should be applied to the lent asset. In addition, a counterparty default risk charge (type 1 exposure) should apply to the lent asset, taking into account the risk-mitigation provided by the asset received if the latter is recognised as a collateral.

If the lent asset does not remain on the balance sheet and the asset received is recognised, the relevant market risk charges should be applied to the asset received. In addition, if, following the contractual terms of the lending arrangement and the legal provisions applying in case of insolvency of the borrower, there is a risk that the lent asset is not given back to the lender at the end of the arrangement, although the received asset has been returned to the borrower, then a capital charge for counterparty default risk should be calculated, based on the initial value of the lent asset.

In case where the lent asset and the asset received are both recognized on the balance sheet, the relevant market risk charges should be applied to both. In addition, a counterparty default risk charge should apply to the lent asset, taking into account the risk-mitigation provided by the asset received if the latter is recognized as a collateral.

If the lending arrangement results in the creation of a liability on the balance sheet, the reinsurance or reinsurance undertaking should consider this liability when calculating the interest rate risk capital charge.

A repo-seller, having agreed to repurchase collateral at a future date, should take account of any risk associated with the collateral even though he isn't presently holding it.

A repo-lender should take account of any concentration, interest, spread or counterparty risk associated with the items exchanged for the collateral, taking into account the credit risk of the repo-seller.

Input

SCR.5.3. The following input information is required²¹:

Mkt_{int}^{Up}	=	Capital requirement for interest rate risk for the “up” shock
Mkt_{int}^{Down}	=	Capital requirement for interest rate risk for the “down” shock
Mkt_{int}	=	Capital requirement for interest rate risk
Mkt_{eq}	=	Capital requirement for equity risk
Mkt_{prop}	=	Capital requirement for property risk
Mkt_{sp}	=	Capital requirement for spread risk
Mkt_{conc}	=	Capital requirement for risk concentrations
Mkt_{fx}	=	Capital requirement for currency risk
$nMkt_{int}^{Up}$	=	Capital requirement for interest rate risk for the “up” shock including the loss absorbing capacity of technical provisions
$nMkt_{int}^{Down}$	=	Capital requirement for interest rate risk for the “down” shock including the loss absorbing capacity of technical provisions
$nMkt_{int}$	=	Capital requirement for interest rate risk including the loss absorbing capacity of technical provisions
$nMkt_{prop}$	=	Capital requirement for property risk including the loss absorbing capacity of technical provisions
$nMkt_{sp}$	=	Capital requirement for spread risk including the loss-absorbing capacity of technical provisions

²¹ Where for all subrisks the first seven capital requirements Mkt are not including the potential loss absorbing capacity of technical provisions.

- $nMkt_{conc}$ = Capital requirement for concentration risk including the loss-absorbing capacity of technical provisions
- $nMkt_{fx}$ = Capital requirement for currency risk including the loss-absorbing capacity of technical provisions
- $nMkt_{eq}$ = Capital requirement for equity risk including the loss-absorbing capacity of technical provisions

Output

SCR.5.4. The module delivers the following output:

- SCR_{mkt} = Capital requirement for market risk
- $nSCR_{mkt}$ = Capital requirement for market risk including the loss-absorbing capacity of technical provisions

Calculation

SCR.5.5. The market sub-risks should be combined to an overall capital requirement SCR_{mkt} for market risk using a correlation matrix as follows:

$$SCR_{mkt} = \sqrt{\sum_{r,c} CorrMkt_{r,c} \cdot Mkt_r \cdot Mkt_c}$$

where

- $CorrMkt$ = the entries of the correlation matrix $CorrMkt$
- Mkt_r, Mkt_c = Capital requirements for the individual market risks under the interest rate stress according to the rows and columns of the correlation matrix $CorrMkt$

and the correlation matrix $CorrMkt$ is defined as:

CorrMkt	Interest	Equity	Property	Spread	Currency	Concentration
Interest	1					
Equity	A	1				
Property	A	0.75	1			

Spread	A	0.75	0.5	1		
Currency	0.25	0.25	0.25	0.25	1	
Concentration	0	0	0	0	0	1

SCR.5.6. The factor A shall be equal to 0 when the capital requirement for interest rate risk as determined in paragraph SCR 5.27, below, is derived from the capital requirement for the risk of an increase in the interest rate term structure including the loss absorbing capacity of technical provision. Otherwise, the factor A shall be equal to 0.5.

SCR.5.7. The capital requirement for $nSCR_{mkt}$ is determined as follows:

$$nSCR_{mkt} = \sqrt{\sum_{r,c} CorrMkt_{r,c} \cdot nMkt_r \cdot nMkt_c}$$

SCR.5.2.Scenario-based calculations

SCR.5.8. The calculations of capital requirements in the market risk module are based on specified scenarios. General guidance about the interpretation of the scenarios can be found in subsection SCR.1.1.

SCR.5.3.Look-through approach

SCR.5.9. In order to properly assess the market risk inherent in collective investment undertakings and other investments packaged as funds, it will be necessary to examine their economic substance. Where possible, this should be achieved by applying a look-through approach in order to assess the risks applying to the assets underlying the investment vehicle. Each of the underlying assets would then be subjected to the relevant sub-modules.

SCR.5.10. The same look-through approach should also be applied for other indirect exposures to underwriting risk (such as in the case of investments in catastrophe bonds), indirect exposures to counterparty risk and indirect exposures to market risk. The look-through approach should not be applied to investments in a related undertaking. Where the (re) insurer's loss in the event of the bankruptcy of the entity is legally limited to the value of its equity holding, the loss in basic own funds should be limited to the value of the equity.

- SCR.5.11. Where a number of iterations of the look-through approach is required (e.g. where an investment fund is invested in other investment funds), the number of iterations should be sufficient to ensure that all material market risk is captured.
- SCR.5.12. The above recommendations should be applied to both passively and actively managed funds, such as money market funds.
- SCR.5.13. Where an undertaking is invested in a collective investment undertaking to which the look-through cannot be applied which strictly follows a target asset allocation, reference shall be made to the asset allocation, provided that the target asset allocation is publicly available and the underlying assets are managed strictly according to that asset allocation. Where data groupings are used, undertakings shall be able to demonstrate that these have been applied in a prudent manner, and that they have been applied to no more than 20% of the total asset value of the undertaking.
- SCR.5.14. Where this approach is not possible and for all collective investments to which the look-through approach could not be applied, the equity type 2 charge shall be applied. In such cases, undertakings shall demonstrate to supervisors why it has not been possible.
- SCR.5.15. Where external asset management firms may delay publicising the fund composition, affected insurance undertakings shall ensure that they are able to access the information required to identify the nature of all underlying assets in line with the requirements to monitor their solvency position.
- SCR.5.16. If the management of the assets representing the employees' benefits liabilities has been outsourced, but the insurance undertaking, acting as a sponsor, is liable for any loss of value of these assets, then the outsourcing arrangement should be looked-through for the calculation of the market risk capital charge.

SCR.5.4.Mkt_{int} interest rate risk

Description

- SCR.5.17. Interest rate risk exists for all assets and liabilities for which the net asset value is sensitive to changes in the term structure of interest rates or interest rate volatility. This applies to both real and nominal term structures. The changes to the interest rate term structure in the interest rate risk sub-module should be applied to all interest rate sensitive assets and liabilities of the undertaking, whether valued by mark-to-model or mark-to-market techniques.
- SCR.5.18. This may involve deriving a mark-to-model valuation that is consistent with the mark-to-market valuation. The impact of the change in the interest rate term structure can then be applied to the mark-to-model valuation. Where this is done, undertakings should assume that the interest rate stresses are applied to the basic

risk-free rate only; any spread in excess of the risk-free return should remain unchanged in the stressed scenarios.

Direct property investments, equity investments, and investments in related undertakings within the meaning of Article 212(1)(b) and 212(2) of Directive 2009/138/EC should not be considered to be interest sensitive.

SCR.5.19. Assets sensitive to interest rate movements will include fixed-income investments, financing instruments (for example loan capital), policy loans, interest rate derivatives.

SCR.5.20. Consideration should be given to the fact that callable bonds and other types of interest rate structures may not be called by the issuer in the event that spreads widen or interest rates increase. This may have an impact on the duration of the asset.

The discounted value of future cash-flows, in particular in the valuation of technical provisions, will be sensitive to a change in the rate at which those cash-flows are discounted.

Input

SCR.5.21. The following input information is required:

BOF = Net value of assets minus liabilities

Output

SCR.5.22. The module delivers the following output:

Mkt_{int}^{Up} = Capital requirement for interest rate risk after upward shocks

Mkt_{int}^{Down} = Capital requirement for interest rate risk after downward shocks

Mkt_{int} = Capital requirement for interest rate risk

$nMkt_{int}^{Up}$ = Capital requirement for interest rate risk after upward shock including the loss absorbing capacity of technical provisions

$nMkt_{int}^{Down}$ = Capital requirement for interest rate risk after downward shock including the loss absorbing capacity of technical provisions

$nMkt_{int}$ = Capital requirement for interest rate risk including the loss absorbing capacity of technical provisions.

Calculation

SCR.5.23. The capital requirement for interest rate risk is determined as the result of two pre-defined scenarios:

$$Mkt_{int}^{Up} = \Delta BOF|_{up}$$

$$Mkt_{int}^{Down} = \Delta BOF|_{down}$$

where $\Delta BOF|_{up}$ and $\Delta BOF|_{down}$ are the changes in the net value of asset and liabilities due to re-valuing all interest rate sensitive items using altered term structures upward and downward. The stress causing the revaluations is instantaneous.

SCR.5.24. Where an undertaking is exposed to interest rate movements in more than one currency, the capital requirement for interest rate risk should be calculated based on the larger of the sum across all currencies of the capital requirement for interest rate risk under the upward shock and the sum across all currencies of the capital requirement for interest rate risk under the downward shock. The sum across all currencies should be considered irrespective of an increase or decrease in basic own funds for one or another currency.

SCR.5.25. The altered term structures are derived by multiplying the current interest rate curve by $(1+s^{up})$ and $(1+s^{down})$, where both the upward stress $s^{up}(t)$ and the downward stress $s^{down}(t)$ for individual maturities t are specified as follows:

Maturity t (years)	relative change $s^{up}(t)$	relative change $s^{down}(t)$
1	70%	-75%
2	70%	-65%
3	64%	-56%
4	59%	-50%
5	55%	-46%
6	52%	-42%
7	49%	-39%
8	47%	-36%
9	44%	-33%
10	42%	-31%
11	39%	-30%
12	37%	-29%
13	35%	-28%
14	34%	-28%
15	33%	-27%
16	31%	-28%
17	30%	-28%
18	29%	-28%

19	27%	-29%
20	26%	-29%
90	20%	-20%

For example, the “stressed” 15-year interest rate $R_1(15)$ in the upward stress scenario is determined as

$$R_1(15) = R_0(15) \bullet (1 + 0.33)$$

where $R_0(15)$ is the 15-year interest rate based on the current term structure.

All interest rates for all maturity points should be shocked with the relevant up or down stress. For maturities not specified above, the value of the shock shall be linearly interpolated. Note that for maturities greater than 90 years a stress of +20% / -20% should be maintained. For maturities shorter than 1 year, the relative change under the s^{up} shock is +70% and -75% under the s^{down} shock.

SCR.5.26. Irrespective of the above stress factors, the absolute change of interest rates in the upward and downward scenario at any maturity should at least be one percentage point. When, for a given maturity, the initial value of the interest rate is negative, the undertaking should calculate the increase or decrease of the interest rate as the product between the s^{up} or s^{down} shock and the absolute value of the initial interest rate.

In the case of negative initial interest rates, the “stressed” 15-year interest rate $R_1(15)$ in the upward stress scenario is determined as

$$R_1(15) = R_0(15) + |R_0(15)| \bullet 0.33$$

and in the downward stress $R_1(15) = R_0(15) - |R_0(15)| \bullet 0.27$

SCR.5.27. The impact of the interest rate stresses on the value of participations in financial and credit institutions shall be considered only on the value of the participations that are not deducted from own funds. The part deducted from own funds shall be considered only to the extent that such impact increases basic own funds.

SCR.5.28. Holdings in subordinated liabilities issued by the related undertaking are treated as financial instruments taking account of contractual terms and applying market stresses as appropriate (i.e. the interest rate, spread, currency, concentration and other risk sub-modules as appropriate).

SCR.5.29. Where there are any assets which exhibit both fixed income and equity characteristics, both of these features should be taken into account when determining which of the standard formula’s risk sub-modules should apply. The determination of which of the standard formula risk sub-modules apply should have regard to the economic form of the asset. Where the asset can be considered as the composite of discrete components, it may be appropriate to apply the relevant stresses to each of these components separately. Where it is not possible to consider the asset as the composite of separate components then the determination of which of the standard

formula risk sub-modules apply should be based on whichever of the fixed income or equity characteristics is predominant in an economic sense.

SCR.5.30. The interest rate scenarios should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.5.31. Additionally, the result of the scenarios should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being tested.

SCR.5.32. The capital requirement for interest rate risk is derived from the type of shock that gives rise to the highest capital requirement including the loss absorbing capacity of technical provisions:

If $nMk_{int}^{Up} > nMk_{int}^{Down}$ then $nMk_{int} = \max(0, nMk_{int}^{Up})$ and $Mk_{int} = \max(0, Mk_{int}^{Up})$.

If $nMk_{int}^{Up} \leq nMk_{int}^{Down}$ then $nMk_{int} = \max(0, nMk_{int}^{Down})$ and $Mk_{int} = \max(0, Mk_{int}^{Down})$.

SCR.5.5.Mkt_{eq} equity risk

Description

SCR.5.33. Equity risk arises from the level or volatility of market prices for equities. Exposure to equity risk refers to all assets and liabilities whose value is sensitive to changes in equity prices.

SCR.5.34. For the calculation of the risk capital requirement, hedging and risk transfer mechanisms should be taken into account according to the principles of subsection SCR.11. However, as a general rule, hedging instruments should only be allowed with the average protection level over the next year unless they are part of a rolling hedging program that meets the requirements set out in subsection SCR.11.5. For example, where an equity option not part of such a rolling hedge program provides protection for the next six months, as a simplification, undertakings should assume that the option only covers half of the current exposure. Where insurance or reinsurance undertakings hold short positions in equity (including put options), these should only be netted off against long equity positions for the purposes of determining the equity risk charge only if the short position meets the requirements to be considered as an acceptable risk mitigation technique for the purposes of the calculation of the SCR with the standard formula.

SCR.5.35. Any other short equity exposure should be ignored when calculating the equity stress in the equity risk sub-module of the standard formula. The residual short equity exposure should not be considered to increase in value after application of the downward shock to equity values.

SCR.5.36. The impact of the equity risk stresses on the value of participations in financial and credit institutions shall be considered only on the value of the participations that are not deducted from own funds.

SCR.5.37. Where there are any assets which exhibit both fixed income and equity characteristics, both of these features should be taken into account when determining which of the standard formula's risk sub-modules should apply. The determination of which of the standard formula risk sub-modules apply should have regard to the economic form of the asset. Where the asset can be considered as the composite of discrete components, it may be appropriate to apply the relevant stresses to each of these components separately. Where it is not possible to consider the asset as the composite of separate components then the determination of which of the standard formula risk sub-modules apply should be based on whichever of the fixed income or equity characteristics is predominant in an economic sense.

Input

SCR.5.38. The following input information is required:

$BOF =$ The net value of assets minus liabilities

Output

SCR.5.39. The module delivers the following output:

Mkt_{eq} = Capital requirement for equity risk

$nMkt_{eq}$ = Capital requirement for equity risk including the loss absorbing capacity of technical provisions

Calculation

SCR.5.40. Undertakings should calculate the capital requirement for equity risk separately:

- (a) for assets and liabilities referred to in point (i) of paragraph 1 of Article 304 of Directive 2009/138/EC,
- (b) for other assets and liabilities.

The capital requirement for equity risk should be calculated as the sum of the capital requirement corresponding respectively to point (a) and (b).

For the purpose of the Quantitative Assessment, the application of point (a) is set out below²².

²² See "Special reference to assets and liabilities referred to in point (i) of paragraph 1 of Article 304 of Directive 2009/138/EC (duration-based approach)"

SCR.5.41. For the calculation of the capital requirement for equity risk, the following split is considered:

- **Type 1 equities** are equities listed in regulated markets in countries which are members of the EEA or the OECD. Units or shares of alternative investment funds authorised as European Long-term Investment Fund or units or shares of collective investment undertakings qualifying as social entrepreneurship funds in accordance with Regulation 346/2013 shall be considered as Type 1 equities, whether listed in regulated markets or not.
- **Type 2 equities** shall comprise equities listed in stock exchanges in countries which are not members of the EEA or OECD, equities which are not listed, private equities, hedge funds, commodities and other alternative investments. They shall also comprise all investments other than those covered in the interest rate risk sub-module, the property risk sub-module or the spread risk sub-module, including the assets and indirect exposures that are subject to equity risk where a look-through approach was not possible.

SCR.5.42. The calculation is carried out as follows:

In a first step, for each category i a capital requirement is determined as the result of a pre-defined stress scenario for category i as follows:

$$Mkt_{eq,i} = \max(\Delta BOF | equity\ shock_i; 0)$$

where

$equity\ shock_i$ = Prescribed fall in the value of equities in the category i

$Mkt_{eq,i}$ = Capital requirement for equity risk with respect to category i ,

SCR.5.43. The equity shock scenarios for the individual categories are specified as follows:

	Type 1	Type 2
$equity\ shock_i$	47.9%	57.9%

Note that the equity stresses above take account of a symmetric adjustment according to Article 106 of Directive 2009/138/EC of X%. The base levels of the two stresses are 39% for type 1 exposures and 49% for type 2 exposures. The applied symmetric adjustment is based on the following:

$$SA = \frac{1}{2} \cdot \left(\frac{CI - AI}{AI} - 8\% \right)$$

where:

- (a) *CI* denotes the current level of the equity index;
- (b) *AI* denotes the weighted average of the daily levels of the equity index over the last 36 months, using equal weights for all daily levels for the days in respect of which the equity index was determined.

The symmetric adjustment has been calculated at a level of +8.9% on the basis of the current level of the equity index as of 31/12/2013 using a gross total return measure for equity performance.

SCR.5.44. For the purpose of the Quantitative Assessment, insurance and reinsurance undertakings may use the transitional measure for the standard equity risk for type 1 equities which are not subject to the duration-based approach as described in SCR.5.57. For the use of the transitional measure for the standard equity risk it should be assumed that und^{er}takings are zero years into the transition, such that a 22% equity shock applies.

SCR.5.45. For the calculation of the equity risk capital requirement, $Mkt_{eq,i}$ is determined as the immediate effect on the net value of asset and liabilities expected in the event of an immediate decrease of *equity shock_i* in value of equities belonging to category *i* taking account of all the participant's individual direct and indirect exposures to equity prices.

SCR.5.46. For the determination of this capital requirement, all equities and equity type exposures have to be taken into account, including private equity as well as certain types of alternative investments.

SCR.5.47. The treatment of equity investments in a participation as set out in subsection SCR.14.2. is as follows:

- For strategic participations as set out in subsection SCR.14.2.4. the equity shock is 22%, whether listed in regulated markets in the countries which are members of the EEA or the OECD (Type 1 equity) or not (Type 2 equity).
-
- The impact of the equity shock on the value of participations in financial and credit institutions shall be considered only on the value of participations that are not deducted from own funds.
- For all other participations the equity shock set out in SCR.5.47. applies.

SCR.5.48. Alternative investments are treated as type 2 equities and should cover all types of equity type risk like hedge funds, derivatives, managed futures, investments in SPVs etc, which can not be allocated to spread risk or classical equity type risk, either directly, or where a look-through approach was not possible.

SCR.5.49. The equity exposure of mutual funds should be allocated on a “look-through” basis as specified for collective investment undertakings in the subsection SCR.5.4.

SCR.5.50. In a second step, the capital requirement for equity risk is derived by combining the capital requirements for the individual categories using a correlation matrix as follows:

$$MKT_{eq} = \sqrt{\sum_{rxc} CorrIndex^{rxc} \cdot Mkt_r \cdot Mkt_c}$$

where

$CorrIndex^{rxc}$ = The entries of the correlation matrix $CorrIndex$
 Mkt_r, Mkt_c = Capital requirements for equity risk per individual category according to the rows and columns of correlation matrix $CorrIndex$

and where the correlation matrix $CorrIndex$ is defined as:

<i>CorrIndex</i>	<i>Type 1</i>	<i>Type 2</i>
<i>Type 1</i>	1	
<i>Type 2</i>	0.75	1

SCR.5.51. The equity scenarios should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.5.52. Additionally, the result of the scenarios should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being tested. The resulting capital requirement is $nMkt_{eq}$.

Special reference to assets and liabilities referred to in point (i) of paragraph 1 of Article 304 of Directive 2009/138/EC (duration-based equity risk approach)

SCR.5.53. For life insurance undertakings providing:

- (a) occupational-retirement-provision business in accordance with Article 4 of Directive 2003/41/EC, or
- (b) retirement benefits paid by reference to reaching, or the expectation of reaching, retirement where the premiums paid for those benefits have a tax deduction which is authorised to policyholders in accordance with the national legislation of the Member State that has authorised the undertaking;

and where

- (i) all assets and liabilities corresponding to this business are ring-fenced, managed and organised separately from the other activities of the insurance undertakings, without any possibility of transfer, and
- (ii) the activities of the undertaking related to points a) and b), in relation to which the approach referred to in this paragraph is applied, are carried out only in the Member State where the undertaking has been authorised, and
- (iii) the average duration of the liabilities corresponding to this business held by the undertaking exceeds an average of 12 years,

the equity risk capital requirement $Mkt_{eq,I, LEV}$ is 22% on the assets and liabilities corresponding to these business²³ for both type 1 and type 2 equities. The *duration* of a future cash-flow should be calculated using the same interest rate curve as in valuating technical provisions. The *average duration* mentioned in Article 304 (1)(b)(iii) of Directive 2009/138/EC should be interpreted as the duration of the total cash-flow of the liabilities. Undertakings may use *duration* instead of *modified duration* where the difference is not material.

As the duration-based equity risk approach is subject to prior supervisory approval once the Solvency II regime enters into force, the ability for undertakings to use this approach for the purpose of the Quantitative Assessment does not pre-empt any future decision by national supervisory authorities to approve or not to approve such approach.

SCR.5.6.Mkt_{prop} property risk

Description

SCR.5.54. Property risk arises as a result of sensitivity of assets, liabilities and financial investments to the level or volatility of market prices of property.

SCR.5.55. The following investments should be treated as property and their risks considered accordingly in the property risk sub-module:

- land, buildings and immovable-property rights;
- property investment for the own use of the insurance undertaking.

SCR.5.56. Otherwise, the following investments should be treated as equity and their risks considered accordingly in the equity risk sub-module:

²³ For Quantitative Assessment purposes, it is assumed that Member States authorize this specific treatment and that the undertakings receive supervisory approval (see Article 304 of the Solvency II Framework Directive (Directive 2009/138/EC)).

- an investment in a company engaged in real estate management, facility management or real estate administration, or
- direct or indirect participations in real estate companies that generate periodic income or which are otherwise intended for investment purposes, or
- an investment in a company engaged in real estate project development or similar activities, or
- an investment in a company which took out loans from institutions outside the scope of the insurance group in order to leverage its investments in properties.

SCR.5.57. Collective real estate investment undertakings should be treated like other collective investment undertakings with a look-through approach.

Input

SCR.5.58. The following input information is required:

$$BOF = \text{Net value of assets minus liabilities}$$

Output

SCR.5.59. The module delivers the following output:

$$Mkt_{prop} = \text{Capital requirement for property risk}^{24}$$

$$nMkt_{prop} = \text{Capital requirement for property risk including the loss absorbing capacity of technical provisions}$$

Calculation

SCR.5.60. The capital requirement for property risk is determined as the result of a pre-defined scenario:

$$Mkt_{prop} = \max(\Delta BOF | \text{propertyShock}; 0)$$

SCR.5.61. The property shock is the immediate effect on the net value of assets and liabilities expected in the event of an instantaneous decrease of 25 % in the value of investments in immovable property, taking account of all the participant's individual direct and indirect exposures to property prices. The property shock takes account of the specific investment policy including e.g. hedging arrangements, gearing etc.

SCR.5.62. The property scenario should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.5.63. Additionally, the result of the scenario should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being tested. The resulting capital requirement is $nMkt_{prop}$.

²⁴ Not including the potential loss absorbing capacity of technical provisions.

SCR.5.7.Mkt_{fx} currency risk

Description

SCR.5.64. Currency risk arises from changes in the level or volatility of currency exchange rates.

SCR.5.65. Undertakings may be exposed to currency risk arising from various sources, including their investment portfolios, as well as assets, liabilities and investments in related undertakings. The design of the currency risk sub-module is intended to take into account currency risk for an undertaking arising from all possible sources.

SCR.5.66. The *local currency* is the currency in which the undertaking prepares its financial statements. All other currencies are referred to as *foreign currencies*. A foreign currency is *relevant* for the scenario calculations if the amount of basic own funds depends on the exchange rate between the foreign currency and the local currency.

SCR.5.67. Note that for each relevant foreign currency C, the currency position should include any investment in foreign instruments where the currency risk is not hedged. This is because the stresses for interest rate, equity, spread and property risks have not been designed to incorporate currency risk.

SCR.5.68. Investments in type 1 equities and type 2 equities referred to in SCR.5.45 which are listed in stock exchanges operating with different currencies shall be assumed to be sensitive to the currency of its main listing. Type 2 equities which are non-listed shall be assumed to be sensitive to the currency of the country in which the issuer has its main operations. Immovable property shall be assumed to be sensitive to the currency of the country in which it is located.

Input

SCR.5.69. The following input information is required:

$$BOF = \text{Net value of assets minus liabilities}$$

Output

SCR.5.70. The module delivers the following output:

$$Mkt_{fx} = \text{Capital requirement for currency risk}$$

$$nMkt_{fx} = \text{Capital requirement for currency risk including the loss absorbing capacity of technical provisions}$$

Calculation

SCR.5.71. The capital requirement for currency risk is determined as the result of two pre-defined scenarios:

$$Mkt_{fx,C}^{Up} = \max(\Delta BOF | \text{fxupward shock}_i; 0)$$

$$Mkt_{fx,C}^{Down} = \max(\Delta BOF | fx \text{ downward shock}_i; 0)$$

SCR.5.72. The scenario *fxupward shock* is an instantaneous rise in the value of 25% of the currency C against the local currency. The scenario *fxdownward shock* is an instantaneous fall of 25% in the value of the currency C against the local currency.

SCR.5.73. All of the participant's individual currency positions and its investment policy (e.g. hedging arrangements, gearing etc.) should be taken into account. Additionally, the result of the scenarios should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being tested. The resulting capital requirements are $nMkt_{fx,C}^{up}$ and $nMkt_{fx,C}^{Down}$.

SCR.5.74. The impact of the currency shocks on the value of participations in financial and credit institutions shall be considered only on the value of participations that are not deducted from own funds.

Special reference to currencies pegged to the euro

SCR.5.75. The size of the shocks for certain non euro but pegged currencies takes into account a reduction factor and are as follows:

- Danish krone (DKK) against EUR = $\pm 2.39\%$
- Bulgarian lev (BGN) against EUR = $\pm 1.04\%$
- Lithuanian litas (LTL) against EUR = $\pm 0.26\%$
- West African CFA Franc (XOF) against EUR = $\pm 0.11\%$
- Central African CFA Franc (XAF) against EUR = $\pm 0.11\%$
- Comorian franc (KMF) against EUR = $\pm 0.96\%$

Reduced shock factors shall also apply between two currencies pegged to the euro (transitivity of shock factors). In this case, the reduced shock factor for each pair of currencies pegged to the euro shall be:

- (a) 2.66% when the local and foreign currencies are the DKK and the LTL;
- (b) 3.45% when the local and foreign currencies are the DKK and the BGN;
- (c) 2.5% when the local and foreign currencies are the DKK and the XOF;
- (d) 2.5% when the local and foreign currencies are the DKK and the XAF;
- (e) 3.37% when the local and foreign currencies are the DKK and the KMF;
- (f) 1.3% when the local and foreign currencies are the LTL and the BGN;

- (g) 0.38% when the local and foreign currencies are the LTL and the XOF;
- (h) 0.38% when the local and foreign currencies are the LTL and the XAF;
- (i) 1.22% when the local and foreign currencies are the LTL and the KMF;
- (j) 1.15% when the local and foreign currencies are the BGN and the XOF;
- (k) 1.15% when the local and foreign currencies are the BGN and the XAF;
- (l) 2% when the local and foreign currencies are the BGN and the KMF;
- (m) 0.22% when the local and foreign currencies are the XOF and the XAF;
- (n) 1.07% when the local and foreign currencies are the XOF and the KMF;
- (o) 1.07% when the local and foreign currencies are the XAF and the KMF.

SCR.5.76. The currency scenarios should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.5.77. For each currency, the capital requirement $nMkt_{fx,C}$ should be determined as the maximum of the values $nMkt_{fx,C}^{Up}$ and $nMkt_{fx,C}^{Down}$. The total capital requirement $nMkt_{fx}$ will be the sum over all currencies of $nMkt_{fx,C}$.

SCR.5.78. For each currency, $Mkt_{fx,C}$ should be equal to $Mkt_{fx,C}^{Up}$ if $nMkt_{fx,C} = nMkt_{fx,C}^{up}$ and otherwise equal to $Mkt_{fx,C}^{Down}$. The total capital requirement Mkt_{fx} will be the sum over all currencies of $Mkt_{fx,C}$.

SCR.5.8.Mkt_{sp} spread risk

Description

SCR.5.79. Spread risk results from the sensitivity of the value of assets, liabilities and financial instruments to changes in the level or in the volatility of credit spreads over the risk-free interest rate term structure. 

SCR.5.80. The spread risk module applies in particular to the following classes of bonds:

- Corporate bonds
- Subordinated debt investments, depending on the contractual terms
- Investment instruments with equity and bond features
- Covered bonds
- Loans other than retail loans secured by a residential mortgage

- Securitisation positions
- Credit derivatives other than for hedging purposes

Consideration should be given to the fact that callable bonds and other types of interest rate structures may not be called by the issuer in the event that spreads widen or interest rates increase. This may have an impact on the duration of the asset.

A repo-seller, having agreed to repurchase collateral at a future date, should take account of any risk associated with the collateral even though he isn't presently holding it.

A repo-lender should take account of any concentration, interest, spread or counterparty risk associated with the items exchanged for the collateral, taking into account the credit risk of the repo-seller.

Holdings in subordinated liabilities issued by the related undertaking are treated as financial instruments taking account of contractual terms and applying market stresses as appropriate (i.e. the interest rate, spread, currency, concentration and other risk sub-modules as appropriate).

Where there are any assets which exhibit both fixed income and equity characteristics, both of these features should be taken into account when determining which of the standard formula's risk sub-modules should apply.

The determination of which of the standard formula risk sub-modules apply should have regard to the economic form of the asset. Where the asset can be considered as the composite of discrete components, it may be appropriate to apply the relevant stresses to each of these components separately. Where it is not possible to consider the asset as the composite of separate components then the determination of which of the standard formula risk sub-modules apply should be based on whichever of the fixed income or equity characteristics is predominant in an economic sense.

SCR.5.81. Furthermore, the spread risk module is applicable to all types of asset-backed securities as well as to all the tranches of structured credit products such collateralised debt obligations. This class of securities includes transactions of schemes whereby the credit risk associated with an exposure or pool of exposures is tranching, having the following characteristics:

- payments in the transaction or scheme are dependent upon the performance of the exposure or pool of exposures; and
- the subordination of tranches determines the distribution of losses during the ongoing life of the transaction or scheme.

SCR.5.82. The spread risk sub-module will further cover in particular credit derivatives, for example (but not limited to) credit default swaps, total return swaps and credit linked notes that are not held as part of a recognised risk mitigation policy.

A protection buyer in a total return swap arrangement should consider the arrangement a risk mitigation technique in accordance with SCR.11. to SCR.12. Any fixed leg of the contract should be subject to spread and interest rate risk.

A protection seller in a total return swap arrangement should take into account any market and counterparty risk associated with the items underlying the swap.

SCR.5.83. In relation to credit derivatives, only the credit risk which is transferred by the derivative is covered in the spread risk sub-module.

SCR.5.84. Instruments sensitive to changes in credit spreads may also give rise to other risks, which should be treated accordingly in the appropriate modules. For example, the counterparty default risk associated with the counterparty of a risk-mitigating transaction should be addressed in the counterparty default risk module, rather than in the spread risk sub-module.

SCR.5.85. The spread risk sub-module also covers the credit risk of other credit risky investments including in particular:

- participating interests
- debt securities issued by, and loans to, affiliated undertakings and undertakings with which an insurance undertaking is linked by virtue of a participating interest
- debt securities and other fixed-income securities
- participation in investment pools
- deposits with credit institutions other than cash at bank, which are treated in the counterparty default risk module

SCR.5.86. The design for the sub-module implies that credit spread risk hedging programmes can still be taken into account when calculating the capital requirement for this risk type. This enables undertakings to gain appropriate recognition of, and allowance for, their hedging instruments – subject to proper treatment of the risks inherent in the hedging programmes

Input

SCR.5.87. The following input information is required:

MV_i	=	the value of the credit risk exposure i
$rating_i$	=	for corporate bonds, the external credit quality step of credit risk exposure i
$duration_i$	=	for corporate bonds, the duration of credit risk exposure i

SCR.5.88. In cases where several credit quality steps are available for a given credit exposure, the second-best credit quality step should be applied.

Output

SCR.5.89. The module delivers the following output:

Mkt_{sp} = Capital requirement for spread risk

$nMkt_{sp}$ = Capital requirement for spread risk including the loss absorbing capacity of technical provisions

Calculation

SCR.5.90. The capital requirement for spread risk is determined as follows:

$$Mkt_{sp} = Mkt_{sp}^{bonds} + Mkt_{sp}^{securitisation} + Mkt_{sp}^{cd}$$

where:

Mkt_{sp}^{bonds} = the capital requirement for spread risk of bonds and loans other than residential mortgage loans fulfilling the criteria as set out in SCR.6.42

$Mkt_{sp}^{securitisation}$ = the capital requirement for spread risk of tradable securities or other financial instruments based on repackaged loans which are offered by way of securitisation within the meaning of point (61) of Article 4(1) of Regulation (EU) No 575/2013

Mkt_{sp}^{cd} = the capital requirement for spread risk on credit derivatives

Spread risk on bonds and loans other than residential mortgage loans

SCR.5.91. The capital requirement for spread risk of bonds and loans other than residential mortgage loans is determined as the result of a pre-defined scenario :

$$Mkt_{sp}^{bonds} = \max(\Delta BOF | \text{spread shock on bonds}; 0)$$

SCR.5.92. The spread risk shock on bonds and loans other than residential mortgage loans is the immediate effect on the net value of asset and liabilities expected in the event of an instantaneous decrease of values in bonds and loans other than non-residential mortgage loans due to the widening of their credit spreads:

$$\sum_i MV_i \cdot F^{up}(rating_i)$$

where:

$F^{up}(rating_i)$ = a function of the credit quality step of the credit risk exposure which is calibrated to deliver a shock consistent with VaR 99.5% following a widening of credit spreads. The spread risk factor $F^{up}(rating_i)$ is capped at a level of 100%.

SCR.5.93. To determine the spread risk capital requirement for bonds and loans other than residential mortgage loans, the following factors F^{up} should be used:

Spread risk factors for bonds

<i>credit quality step</i> <i>duration_i (years)</i>	0	1	2	3	4	5	6
up to 5	0.9 %. <i>duration_i</i>	1.1 %. <i>duration_i</i>	1.4 %. <i>duration_i</i>	2.5 %. <i>duration_i</i>	4.5 %. <i>duration_i</i>	7.5 %. <i>duration_i</i>	7.5 %. <i>duration_i</i>
More than 5 and up to 10	4.5% + 0.5 %.(<i>duration_i - 5</i>)	5.5% + 0.6%.(<i>duration_i - 5</i>)	7.0% + 0.7%.(<i>duration_i - 5</i>)	12.5% + 1.5%.(<i>duration_i - 5</i>)	22.5% + 2.5%.(<i>duration_i - 5</i>)	37.5% + 4.2%.(<i>duration_i - 5</i>)	37.5% + 4.2%.(<i>duration_i - 5</i>)
More than 10 and up to 15	7.2% + 0.5 %.(<i>duration_i - 10</i>)	8.4% + 0.5 %.(<i>duration_i - 10</i>)	10.5% + 0.5 %.(<i>duration_i - 10</i>)	20.0% + 1.0 %.(<i>duration_i - 10</i>)	35.0% + 1.8 %.(<i>duration_i - 10</i>)	58.5% + 0.5 %.(<i>duration_i - 10</i>)	58.5% + 0.5 %.(<i>duration_i - 10</i>)
More than 15 and up to 20	9.7% + 0.5 %.(<i>duration_i - 15</i>)	10.9% + 0.5 %.(<i>duration_i - 15</i>)	13.0% + 0.5 %.(<i>duration_i - 15</i>)	25.0% + 1.0 %.(<i>duration_i - 15</i>)	44.0% + 0.5 %.(<i>duration_i - 15</i>)	61.0% + 0.5 %.(<i>duration_i - 15</i>)	61.0% + 0.5 %.(<i>duration_i - 15</i>)
More than 20	12.2% + 0.5 %.(13.4% + 0.5 %.(15.5% + 0.5 %.(30.0% + 0.50 %.(46.6% + 0.5 %.(63.5% + 0.5 %.(63.5% + 0.5 %.(

	$duration_i - 20$)						
--	---------------------	---------------------	---------------------	---------------------	---------------------	---------------------	---------------------

For unrated exposures the spread risk factors F^{up} for bonds should be used:

$duration_i$ (years)	F^{up}
up to 5	3.0 % . $duration_i$
More than 5 and up to 10	15.0%+1.7%.($duration_i - 5$)
More than 10 and up to 15	23.5%+1.2%.($duration_i - 10$)
More than 15	Min(35.5% + 0.5 %.($duration_i - 20$);1)

SCR.5.94. The factors F^{up} are applied to assess the impact of a widening of spreads on the value of bonds. For example, for a bond with a credit quality step 0 and with a duration of 5 years a loss in value of 4.5% would be assumed under the widening of spreads scenario.

SCR.5.95. The shock factors of function F^{up} will be multiplied with the modified duration of a bond. For variable interest rate bonds, the modified duration used in the calculation should be equivalent to a fixed income bond with coupon payments equal to the forward interest rate. If the modified duration is less than 1 year, it should be treated as 1 year.

SCR.5.96. For exposures to bonds issued by (re-) insurance undertakings that do not meet their MCR, the following shock factors shall apply:

$duration_i$ (years)	risk factor FUP_i
up to 5	7.5 % . $duration_i$
More than 5 and up to 10	37.50% + 4.20%.($duration_i - 5$)
More than 10 and up to 15	58.50% + 0.50 %.($duration_i - 10$)
More than 15 and up to 20	61% + 0.50 %.($duration_i - 15$)
More than 20	Min(63.50% + 0.50 %.($duration_i - 20$);1)

Special reference to covered bonds

SCR.5.97. In order to provide covered bonds with a treatment in spread risk sub-module according their specific risk features, the risk factor F^{up} should be applied according to the table below, subject to the following requirements being met:

- the asset has a credit quality step of 0 or 1
- the covered bond meets the requirements defined in Article 22(4) of the UCITS directive 85/611/EEC

<i>Credit quality Step</i>	0	1
<i>Duration_i</i> (years)		
up to 5	$0.7\% \cdot \textit{duration}_i$	$0.9\% \cdot \textit{duration}_i$
More than 5 years	$\text{Min}(3.5\% + 0.5\% \cdot (\textit{duration}_i - 5); 1)$	$\text{Min}(4.50\% + 0.5\% \cdot (\textit{duration}_i - 5); 1)$

Special reference to exposures to governments, central banks, multilateral development banks and international organisations

SCR.5.98. No capital requirement should apply for the purposes of this sub-module to exposures to EU Member States' central government and central banks denominated and funded in the domestic currency of that central government and the central bank, or instruments issued by a multilateral development bank as listed in Annex P, Part 1, Number 4 of the Capital Requirements Directive (2006/48/EC) or instruments issued by an international organisation listed in Annex P, Part 1, Number 5 of the Capital Requirements Directive (2006/48/EC) or instruments issued by the European Central Bank. The zero risk charge referred to in this paragraph only applies to debt exposures to the named organisations, and doesn't extend to investments in entities which are owned by one of the named organisations.

SCR.5.99. For the purpose of the spread risk sub-module, exposures to regional governments and local authorities established in the jurisdiction of a Member State shall be treated as exposures to the central government for which a zero capital requirement applies, provided there is no difference in risk between such exposures because of the specific revenue-raising powers of the former, and specific institutional arrangements exist, the effect of which is to reduce the risk of default.

SCR.5.100. To determine the spread risk capital requirement for exposures to central governments and central banks denominated and funded in the domestic currency, other than those mentioned in SCR.5.98., the following factors F^{up} should be used:

Spread risk factors for exposures to non-EU  governments and central banks denominated and funded in the domestic currency

<i>credit quality step</i> <i>Duration_i</i> <i>(years)</i>	0	1	2	3	4	5	6
up to 5	0%	0%	1.1 %. <i>duration_i</i>	1.4 %. <i>duration_i</i>	2.5 %. <i>duration_i</i>	4.5 %. <i>duration_i</i>	4.5 %. <i>duration_i</i>
More than 5 and up to 10	0%	0%	5.5% + 0.6%.(<i>duration_i</i> -5)	7% + 0.7%.(<i>duration_i</i> -5)	12.5%+ 1.5%.(<i>duration_i</i> -5)	22.5% + 2.5%.(<i>duration_i</i> -5)	22.5% + 2.5%.(<i>duration_i</i> -5)
More than 10 and up to 15	0%	0%	8.4% + 0.5 %.(<i>duration_i</i> -10)	10.5% + 0.5 %.(<i>duration_i</i> -10)	20% + 1 %.(<i>duration_i</i> -10)	35.05% + 1.80 %.(<i>duration_i</i> -10)	35.05% + 1.80 %.(<i>duration_i</i> -10)
More than 15 and up to 20	0%	0%	10.90% + 0.50 %.(<i>duration_i</i> -15)	13% + 0.50 %.(<i>duration_i</i> -15)	25% + 1 %.(<i>duration_i</i> -15)	44.% + 0.5 %.(<i>duration_i</i> -15)	44.% + 0.5 %.(<i>duration_i</i> -15)
More than 20	0%	0%	13.4% + 0.5 %.(<i>duration_i</i> -20)	15.5% + 0.5 %.(<i>duration_i</i> -20)	30% + 0.5 %.(<i>duration_i</i> -20)	46.5% + 0.50 %.(<i>duration_i</i> -20)	46.5% + 0.5 %.(<i>duration_i</i> -20)

SCR.5.101. In order to allow an analysis of the impact of these provisions, undertakings should disclose their exposures to government and central banks.

Spread risk on securitisation positions

SCR.5.102. The capital requirement for spread risk of securitisation positions²⁵ is determined as the result of the pre-defined scenario:

$$Mkt_{sp}^{securitisation} = \max(\Delta BOF | \text{direct spread shock on securitisation positions}; 0)$$

SCR.5.103. The direct spread shock on securitisation positions is the immediate effect on the net asset value expected in the event of the following instantaneous decrease of values in securitisation positions due to the widening of their credit spreads:

²⁵ When Solvency 2 is in place, if the originator or sponsor of a structure credit product issued after 1 January 2011 or where underlying exposures are added or substituted after 31 December 2014 does not comply with the 5% net retention rate foreseen in the CRD (2006/48/EC), the capital requirement for the product should be 100%, regardless of the seniority of the position. For the purposes of ASSESSMENT, such specific treatment should not be applied. Undertakings are however required to fill the relevant questions in the questionnaire.

$$\sum_i MV_i \cdot F^{up}(rating_i; duration_i)$$

where:

$F^{up}(rating_i, duration_i)$ = a function of the credit quality step of the credit risk exposure which is calibrated to deliver a shock consistent with VaR 99.5% following a widening of credit spreads, where the $F^{up}(rating_i)$ factor is capped at 100%

SCR.5.104. To determine the aggregate spread risk capital requirement for securitisation positions, the following split into type 1, type 2 securitisation positions and re-securitisation positions should be made:

Type 1 securitisations shall include exposures to securitisations that meet the following criteria:

- (a) the exposure has been assigned to credit quality step 3 or better;
- (b) the securitisation is listed in a regulated market of a country which is a member of the EEA or the OECD;
- (c) after the delivery of an enforcement notice and where applicable an acceleration notice, the tranche is not subordinated to other tranches of the same securitisation transaction or scheme in respect of receiving principal and interest payments;
- (d) the underlying assets have been acquired by the SSPE in a manner that is enforceable against any third party and are beyond the reach of the seller (originator or sponsor) and its creditors including in the event of the seller's insolvency;
- (e) there are no severe clawback provisions in the jurisdiction of the seller (originator or sponsor); this includes but is not limited to provisions under which the sale of the underlying assets can be invalidated by the liquidator of the seller (originator or sponsor) solely on the basis that it was concluded within a certain period before the declaration of the seller's insolvency or provisions where the SSPE can prevent such invalidation only if it can prove that it was not aware of the insolvency of the seller at the time of sale;
- (f) the securitisation includes provisions to ensure that a default of the servicer does not result in a termination of servicing and provisions to ensure the replacement of derivative counterparties and liquidity providers if applicable;
- (g) all the assets underlying the securitisation belong to only one of the following categories:
 - (i) residential mortgages;
 - (ii) loans to small and medium-sized enterprises;
 - (iii) auto loans;
 - (iv) leased property;
 - (v) consumer loans;
 - (vi) credit card receivables.

The pool of underlying assets may only include derivatives if these are used strictly for hedging currency risk and interest rate risk.

(h) the pool of underlying assets do not include loans that were granted to credit-impaired obligors; where a credit-impaired obligor is a borrower (or where applicable, a guarantor) which:

(i) has declared bankruptcy, agreed with his creditors to a debt dismissal or reschedule or had a court grant his creditors a right of enforcement or material damages as a result of a missed payment within three years prior to the date of origination; or

(ii) is on an official registry of persons with adverse credit history; or

(iii) has a credit assessment by a market accepted credit agency or by the originator or by the sponsor indicating a significant risk that contractually agreed payments will not be made compared to the average obligor for this type of loans in the relevant jurisdiction.

(i) the pool of underlying assets do not include loans in default within the meaning of Article 178(1) of Regulation 575/2013 (Mortgage Credit Regulation) at the time of issuance of the securitisation or when incorporated in the pool of underlying assets at any time after issuance;

(j) except for securitisations where the underlying assets are credit card receivables, at least one payment has been made by obligors on the loans or lease;

(k) in the case of securitisations where the underlying assets are residential mortgages, the pool of underlying residential mortgage loans do not include any loan that was marketed and underwritten on the premise that the loan applicant or, where applicable intermediaries, were made aware that the information provided might not be verified by the lender;

(l) in the case of securitisations backed by residential mortgages, the assessment of the borrower's creditworthiness meet the requirements set out in [Article 18 of the Mortgage Credit Directive] or equivalent requirements in non-EEA jurisdictions;

(m) in the case of securitisations backed by consumer loans, the assessment of the borrower's creditworthiness meets the requirements set out in Article 8 of Directive 2008/48/EC (Consumer Credit Directive) or equivalent requirements in non-EEA jurisdictions;

(n) where the issuer, originator or sponsor of the securitisation is established in the Union, it discloses information, in accordance with Article 8b of Regulation 1060/2009, on the credit quality and performance of the underlying assets, the structure of the transaction, the cash flows and any collateral supporting the exposures as well as any information that is necessary for investors to conduct comprehensive and well-informed stress tests; where the issuer, originator and sponsors are established outside the Union, comprehensive loan-level data in compliance with standards generally accepted by market participants is made available to existing and potential investors and regulators at issuance and on a regular basis.

SCR.5.105. **Type 2 securitisations** shall include all securitisations that do not qualify as Type 1 securitisations or re-securitisation positions.

SCR.5.106. Undertakings may use a transitional for securitisations issued before the entry into force of Solvency II, whereby it is assumed that securitisation positions that meet the criteria under (a), (c), (d) and (g) can be considered as Type 1 securitisations.

SCR.5.107. For Type 1 securitisations the following factors F^{up} should be used:

Spread risk factors for Type 1 securitisation positions (direct spread shock)

Credit quality step	0	1	2	3
Risk factor F^{up}_i	4.3% . <i>duration_i</i>	8.5% . <i>duration_i</i>	14.8% . <i>duration_i</i>	17% . <i>duration_i</i>

For Type 2 securitisations the following factors F^{up} should be used:

Spread risk factors for Type 2 securitisation positions (direct spread shock)

Credit quality step	0	1	2	3	4	5	6
Risk factor F^{up}_i	12.5% . <i>duration_i</i>	13.4% . <i>duration_i</i>	16.6% . <i>duration_i</i>	19.7% . <i>duration_i</i>	82% . <i>duration_i</i>	100% . <i>duration_i</i>	100% . <i>duration_i</i>

For resecuritisations the following factors F^{up} should be used:

Spread risk factors for structured products which are resecuritisation exposures (direct spread shock)

Credit quality step	0	1	2	3	4	5	6
Risk factor F^{up}_i	33% . <i>duration_i</i>	40% . <i>duration_i</i>	51% . <i>duration_i</i>	91% . <i>duration_i</i>	100% . <i>duration_i</i>	100% . <i>duration_i</i>	100% . <i>duration_i</i>

SCR.5.108. For securitisation positions of type 2 and resecuritisation positions for which a credit quality step is not available shall be assigned a risk factor F^{up} of 100%.

Spread risk on credit derivatives

SCR.5.109. For credit derivatives a scenario-based approach is followed. Credit derivatives encompass credit default swaps (CDS), total return swaps (TRS), and credit linked notes (CLN), where:

- the undertaking does not hold the underlying instrument or another exposure where the basis risk between that exposure and the underlying instrument is immaterial in all possible scenarios; or
- the credit derivative is not part of the undertaking's risk mitigation policy.

SCR.5.110. The capital requirement for spread risk of credit derivatives is determined as the result of two pre-defined scenario :

$$Mkt_{sp,upward}^{cd} = \max(\Delta BOF | \text{upward spread shock on credit derivatives}; 0)$$

$$Mkt_{sp,downward}^{cd} = \max(\Delta BOF | \text{downward spread shock on credit derivatives}; 0)$$

SCR.5.111. The upward (respectively downward) spread risk shock on credit derivatives is the immediate effect on the net value of asset and liabilities, after netting with offsetting corporate bond exposures, expected in the event of an instantaneous widening (respectively decrease) of the credit spreads of credit derivatives of the following magnitude:

Spread risk factors for credit derivatives

Credit quality step	Widening of the spreads (in absolute terms)	Decrease of the spreads (in relative terms)
0	+130 bp	-75%
1	+150 bp	-75%
2	+260 bp	-75%
3	+450 bp	-75%
4	+840 bp	-75%
5	+1620 bp	-75%
6	+1620 bp	-75%
Unrated	+500 bp	-75%

SCR.5.112. The capital requirement for spread risk on credit derivatives derived from the type of shock that gives rise to the highest capital requirement including the loss absorbing capacity of technical provisions:

$$\text{If } nMkt_{sp,upward}^{cd} > nMkt_{sp,downward}^{cd} \text{ then } Mkt_{sp}^{cd} = Mkt_{sp,upward}^{cd} \text{ and } nMkt_{sp}^{cd} = nMkt_{sp,upward}^{cd}.$$

If $nMkt_{sp,upward}^{cd} \leq nMkt_{sp,downward}^{cd}$ then $Mkt_{sp}^{cd} = Mkt_{sp,downward}^{cd}$ and $nMkt_{sp}^{cd} = nMkt_{sp,downward}^{cd}$.

Application of the spread risk scenarios to the matching adjustment portfolios

SCR.5.113. Where insurance undertakings apply the matching adjustment, they shall carry out the scenario based calculation for spread risk in the following way:

- a. The assets in the assigned portfolio shall be subject to an instantaneous decrease in the value for spread risk according to the spread risk factors specified in SCR.5.86., SCR. 5.91, SCR.5.92., SCR.5.93., SCR.5.94. and SCR.5.99
- b. The technical provisions of the portfolio insurance or reinsurance obligations to which the matching adjustment is applied shall be recalculated to take into account the impact on the amount of the matching adjustment of the instantaneous decrease in the value of the assigned portfolio of assets for spread risk. In particular, the fundamental spread on the assigned portfolio of assets shall increase by an absolute amount equal to the product of the spread risk factors specified in SCR.5.86., SCR. 5.91, SCR.5.92., SCR.5.93., SCR.5.94. and SCR.5.99 and the following reduction factors:

Credit quality step	0	1	2	3	4	5	6
Reduction factor	45%	50%	60%	75%	100%	100%	100%

As the use of the matching adjustment is subject to prior supervisory approval once the Solvency II regime enters into force, the ability for undertakings to apply the matching adjustment for the purpose of the Quantitative Assessment does not prevent any future decision by national supervisory authorities to approve or not to approve its application.

Simplified calculations for the spread risk on bonds and loans other than residential mortgage loans

SCR.5.114. The following simplification may be used provided:

SCR.5.115.

- a. The simplification is proportionate to the nature, scale and complexity of the risks that the undertaking faces.
- b. The standard calculation of the spread risk sub-module is an undue burden for the undertaking.

SCR.5.116. The simplification is defined as follows:

$$SCR_{bonds} = MV^{bonds} \cdot \left(\sum_i \%MV_i^{bonds} \cdot stress_i + \%MV_{norating}^{bonds} \cdot \min(dur_{norating} \cdot 0.03 ; 1) \right) + \Delta Liab_{ul}$$

where:

MV^{bonds}	=	Total market value of bond and loan portfolio
$\%MV_i^{bonds}$	=	Proportion of bond and loans portfolio at Credit quality step i
$\%MV_{norating}^{bonds}$	=	Proportion of bond and loans portfolio for which no rating is available
$stress_i$	=	Defined as in the product of the average duration and the F^{up} spread shock factors defined in the table below
$dur_{no\ rating}$	=	Average duration of bond and loan portfolio for which no Credit quality step is available, weighted with the market value of the bonds

and where $\Delta Liab_{ul}$ is the overall impact on the liability side for policies where the policyholders bear the investment risk with embedded options and guarantees of the stressed scenario, with a minimum value of 0 (sign convention: positive sign means losses). The stressed scenario is defined as a drop in value on the assets by

$$MV^{bonds} \cdot \left(\sum_i \%MV_i^{bonds} \cdot stress_i + \%MV_{norating}^{bonds} \cdot \min(dur_{norating} \cdot 0.03 ; 1) \right)$$

where F^{up} spread shock factors are defined as:

Credit quality step	0	1	2	3	4	5	6
Capital charge	0.9%	1.1%	1.4%	2.5%	4.5%	7.5%	7.5%

SCR.5.9.Mkt_{conc} market risk concentrations

Description

SCR.5.117. The scope of the concentration risk sub-module extends to assets considered in the equity, spread risk and property risk sub-modules, and excludes assets covered by the counterparty default risk module in order to avoid any overlap between both elements of the standard calculation of the SCR.

SCR.5.118. As an example, risks derived from concentration in cash held at a bank are captured in the counterparty default risk module, while risks corresponding to

concentration in other bank assets should be reflected in the concentration risk sub-module.

SCR.5.119. An appropriate assessment of concentration risks needs to consider both the direct and indirect exposures derived from the investments included in the scope of this sub-module.

SCR.5.120. For the sake of simplicity and consistency, the definition of market risk concentrations regarding financial investments is restricted to the risk regarding the accumulation of exposures with the same counterparty. It does not include other types of concentrations (e.g. geographical area, industry sector, etc.).

SCR.5.121. The capital requirement for market risk concentration shall be calculated on the basis of single name exposures. For this purpose exposures to undertakings which belong to the same group, as defined in Article 212 of Directive 2009/138/EC or to the same financial conglomerate as defined in Article 2(14) of Directive 2002/87/EC shall be treated as a single name exposure.

Input

SCR.5.122. Risk exposures in assets need to be grouped according to the counterparties involved.

E_i = Net Exposure at default to counterparty i

$Assets_{xl}$ = Total amount of assets considered in this sub-module.

$rating_i$ = External credit quality step of the counterparty i

SCR.5.123. Where an undertaking has more than one exposure to a counterparty, then E_i is the aggregate of those exposures at default to this counterparty considered as a single name exposure. The aggregate exposure at default across all single name exposures considered for the market risk concentration module shall be reduced by the amount of exposure at default to counterparties belonging to that single name exposure and for which the risk factor g_i for market risk concentration is 0%.

$rating_i$ should be a weighted average credit quality step on this single name exposure, determined as the whole number nearest to the average of the credit quality steps of the individual exposures to this counterparty, weighted by the net exposure at default in respect of that exposure to this counterparty.

SCR.5.124. The exposure at default to an individual counterparty i should comprise assets covered by the concentration risk sub-module, including hybrid instruments, e.g. junior debt, mezzanine CDO tranches.

SCR.5.125. Exposures via investment funds or such entities whose activity is mainly the holding and management of an undertaking's own investment need to be considered on a look-through basis. The same holds for CDO tranches and similar investments embedded in 'structured products'. The concentration risk module should not be applied at the level of an investment fund but at the level of each sub-counterparty,

after aggregation of exposures to each sub-counterparty at the portfolio level. If the underlying single name exposures of the investment fund cannot be determined, the concentration risk should be applied at the level of the investment fund.

Output

SCR.5.126. The module delivers the following outputs:

Mkt_{conc} = Total capital requirement concentration risk sub-module

Calculation

SCR.5.127. The calculation is performed in three steps: (a) relative excess exposure, (b) risk concentration capital requirement per single name exposure, (c) aggregation.

SCR.5.128. The relative excess exposure is calculated as:

$$XS_i = \max\left(0, \frac{E_i}{Assets_{xl}} - CT \cdot Assets_{xl}\right)$$

where the concentration threshold CT, depending on the credit quality step of counterparty i, is set as follows:

credit quality step	Concentration threshold (CT)
0	3%
1	3%
2	3%
3	1.5%
4	1.5%
5	1.5%
6 or unrated	1.5%

Where $Assets_{xl}$ is the total amount of assets considered in the concentration risk sub-module. $Assets_{xl}$ should not include:

1. assets held in respect of life insurance contracts where the investment risk is fully borne by the policy holders;

2. exposures an insurance or reinsurance undertaking has to a counterparty which belongs to the same group as the insurance or reinsurance undertaking, provided that the following conditions are met:
 - (i) the counterparty is an insurance or reinsurance undertaking, an insurance holding company, a mixed financial holding company or an ancillary services undertaking which is subject to prudential requirements;
 - (ii) the counterparty is fully consolidated in the same consolidation scope as the undertaking;
 - (iii) the counterparty is subject to the same risk evaluation, measurement and control procedures as the undertaking;
 - (iv) the counterparty is established in the Union;
 - (v) there is no current or foreseen material practical or legal impediment to the prompt transfer of own funds or repayment of liabilities from the counterparty to the undertaking;
3. the value of the participations as defined in Article 92(2) of Directive 2009/138/EC in financial and credit institutions that are deducted from own funds;
4. assets covered in the counterparty default risk module.
5. deferred tax assets
6. intangible assets

SCR.5.129. The capital requirement for market risk concentration on a single name exposure i $Conc_i$ shall be equal to the loss in the basic own funds that would result from an instantaneous relative decrease in the value of the assets corresponding to the single name exposure i of the following amount:

$$Conc_i = XS_i \cdot g_i$$

where the parameter g_i , depending on the credit quality step of the counterparty, is determined as follows:

Credit quality step	0	1	2	3	4	5	6	Unrated
Risk factor g_i	12 %	12 %	21 %	27 %	73 %	73 %	73 %	73%

SCR.5.130. For counterparties without credit quality steps that meet the following requirements,

- a. are (re)insurance undertakings,
- b. meet their MCR,

- c. the Solvency ratios are determined according to the requirements set out in these specifications (Solvency II ratios),
- d. the Solvency ratios are determined consistently to the scenario under consideration.

the parameter g_i , depending on the solvency ratio is determined as follows

Solvency ratio	196% or higher	175%	122%	100%	95% or lower
Risk factor g_i	12 %	21 %	27 %	64,5 %	73 %

SCR.5.131. Where the eligible amount of own funds of a (re)insurance undertaking to cover the SCR falls in between the eligible amount values specified above, the value of the risk factor g_i for market risk concentration shall be linearly interpolated from the eligible amount (solvency ratio) and risk factor values specified in the table right above.

SCR.5.132. For other single name exposures, the parameter g_i should be 73%.

SCR.5.133. The capital requirement for concentration risk is determined assuming no correlation among the requirements for each counterparty I, and it should be equal to the following:

$$Mkt_{conc} = \sqrt{\sum_i (Conc_i^2)}$$

SCR.5.134. This sub-module (as for the whole of the market risk module) is in the scope of the approach for the loss absorbency of technical provisions.

Special reference to covered bonds

SCR.5.135. In order to provide covered bonds with a treatment in concentration risk sub-module according their specific risk features, the concentration threshold CT should be 15% when the following requirements are met:

- the asset has a credit quality step of 0 or 1 or better
- the covered bond meets the requirements defined in Article 22(4) of the UCITS Directive 85/611/EEC

Exposures in the form of covered bonds shall be considered as single name exposures, regardless of other net exposures at default to the same counterparties. Other net exposures at default to the same counterparties as the counterparties of exposures in the form of covered bonds shall be considered as separate single name counterparties.

Special reference to unrated credit institutions and financial institutions

SCR.5.136. Single name exposures for which a credit assessment by a nominated ECAI is not available, which are credit institutions and financial institutions within the meaning of Article 4(1) and (5) of Directive 2006/48/EC and which meet the requirements of Directive 2006/48/EC shall be assigned a risk factor g_i for market risk concentration of 64.5 %.

Concentration risk capital in case of immovable properties

SCR.5.137. Undertakings should identify the exposures in a single property higher than 10% of 'total assets' (concentration threshold) considered in this sub-module according to paragraphs above (subsection *description*).

SCR.5.138. For this purpose the undertaking should take into account both properties directly owned and those indirectly owned (i.e. funds of properties), and both ownership and any other real exposure (mortgages or any other legal right regarding properties).

SCR.5.139. Properties located in the same building or sufficiently nearby should be considered a single property.

SCR.5.140. The risk concentration capital requirement per property i is calculated as the result of a pre-defined scenario:

$$Conc_i = \Delta BOF / \text{concentration shock}$$

The concentration risk shock on a property 'i' is the immediate effect on the net value of asset and liabilities expected in the event of an instantaneous decrease of values of $0.12 \cdot XS_i$ in the concentrated exposure.

Special reference to exposures to governments, central banks, multilateral development banks and international organisations

SCR.5.141. No capital requirement should apply for the purposes of this module to exposures to EU Member States' central government and central banks denominated and funded in the domestic currency of that central government and the central bank, or instruments issued by a multilateral development bank as listed in Annex P, Part 1, Number 4 of the Capital Requirements Directive (2006/48/EC) or instruments issued by an international organisation listed in Annex P, Part 1, Number 5 of the Capital Requirements Directive (2006/48/EC) or instruments issued by the European Central Bank. The zero risk charge referred to in this paragraph only applies to debt exposures to the named organisations, and doesn't extend to investments in entities which are owned by one of the named organisations.

SCR.5.142. For the purpose of the market risk concentration sub-module, exposures to regional governments and local authorities established in the jurisdiction of a Member State shall be treated as exposures to the central government for which a zero capital requirement applies, provided there is no difference in risk between such exposures because of the specific revenue-raising powers of the former, and specific institutional arrangements exist, the effect of which is to reduce the risk of default.

SCR.5.143.

SCR.5.144. To determine the concentration risk capital requirement for exposures to central governments and central banks denominated and funded in the domestic currency, other than those mentioned in SCR5.141, the following risk factors g^* should be used:

Concentration risk factors for exposures to non-EU governments and central banks denominated and funded in the domestic currency

Credit quality step	0	1	2	3	4	5	6	Unrated
Risk factor g_i	0 %	0 %	12%	21%	27%	73 %	73 %	73%

Special reference to exposures to bank deposits

SCR.5.145. Bank deposits considered in the concentration risk sub-module²⁶ can be exempted to the extent their full value is covered by a government Deposit Guarantee Scheme in the EEA area, the guarantee is applicable unconditionally to the undertaking and provided there is no double-counting of such guarantee with any other element of the SCR calculation.

SCR.5.10. Treatment of risks associated to SPV notes held by an undertaking

SCR.5.146. SPV notes should be treated as follows:

- 1) SPV notes having mostly the features of fixed-income bonds, authorized, where the SPV is defined as in point (26) of Article 13 of Directive 2009/138/EC²⁷ and meet the requirements set out in Article 211 of Directive 2009/138/EC and has credit quality step 3 or better: Their risks should be considered in the 'spread risk', 'interest rate risk' and concentration sub-modules according its credit quality step.
- 2) Others SPV notes, including those having significant features of equities (i.e. equity tranche notes): Their risks should be considered in the 'equity risk' sub-module. For this purpose the SPV notes should be considered as non-traded equities, unless they are traded actively in a financial market.

²⁶ Risks derived from concentration in cash held at a bank are captured in the counterparty default risk module and are therefore not subject to the spread risk sub-module..

²⁷ "special purpose vehicle" means any undertaking, whether incorporated or not, other than an existing insurance or reinsurance undertaking, which assumes risks from insurance or reinsurance undertakings and which fully funds its exposure to such risks through the proceeds of a debt issuance or any other financing mechanism where the repayment rights of the providers of such debt or financing mechanism are subordinated to the reinsurance obligations of such an undertaking

DRAFT

SCR.6. SCR Counterparty risk module

SCR.6.1.Introduction

Description

SCR.6.1. The counterparty default risk module should reflect possible losses due to unexpected default of the counterparties and debtors of undertakings over the forthcoming twelve months. The scope of the counterparty default risk module includes risk-mitigating contracts, such as reinsurance arrangements, securitisations and derivatives, and receivables from intermediaries, as well as any other credit exposures which are not covered in the spread risk sub-module.

SCR.6.2. For each counterparty, the counterparty default risk module should take account of the overall counterparty risk exposure of the undertaking concerned to that counterparty, irrespective of the legal form of its contractual obligations to that undertaking.

SCR.6.3. A differentiation of two kinds of exposures, in the following denoted by type 1 and type 2 exposures, and a different treatment according to their characteristics has to be applied.

SCR.6.4. The class of type 1 exposures covers the exposures which may not be diversified and where the counterparty is likely to be rated. The class should consist of exposures in relation to

- a) Risk-mitigation contracts including reinsurance arrangements, insurance securitisations and derivatives;
- b) Cash at bank;
- c) Deposits with ceding undertakings, where the number of single name exposures does not exceed 15;
- d) Commitments received by an insurance or reinsurance undertaking which have been called up but are unpaid, where the number of single name exposures does not exceed 15, including called up but unpaid ordinary share capital and preference shares, called up but unpaid legally binding commitments to subscribe and pay for subordinated liabilities, called up but unpaid initial funds, members' contributions or the equivalent basic own-fund item for mutual and mutual-type undertakings, called up but unpaid guarantees, called up but unpaid letters of credit, called up but unpaid claims which mutual or mutual-type associations may have against their members by way of a call for supplementary contributions;
- e) Legally binding commitments which the undertaking has provided or arranged and which may create payment obligations depending on the credit standing or default on a counterparty including guarantees, letters of credit, letters of comfort which the undertaking has provided.

SCR.6.5. The capital requirement for securities lending arrangements and securities repurchase arrangements should follow the recognition of items exchanged in the

Solvency II balance sheet, also taking into account contractual terms and risks stemming from the agreement.

If a lent asset remains in the balance sheet, and the asset received is not recognized, the relevant market risk charges should be applied to the lent asset. In addition, a counterparty default risk charge (type 1 exposure) should apply to the lent asset, taking into account the risk-mitigation provided by the asset received if the latter is recognised as a collateral.

If the lent asset does not remain on the balance sheet and the asset received is recognised, the relevant market risk charges should be applied to the asset received. In addition, if, following the contractual terms of the lending arrangement and the legal provisions applying in case of insolvency of the borrower, there is a risk that the lent asset is not given back to the lender at the end of the arrangement, although the received asset has been returned to the borrower, then a capital charge for counterparty default risk should be calculated, based on the initial value of the lent asset.

In case where the lent asset and the asset received are both recognized on the balance sheet, the relevant market risk charges should be applied to both. In addition, a counterparty default risk charge should apply to the lent asset, taking into account the risk-mitigation provided by the asset received if the latter is recognized as a collateral.

If the lending arrangement results in the creation of a liability on the balance sheet, the reinsurer or reinsurance undertaking should consider this liability when calculating the interest rate risk capital charge.

SCR.6.6. For determining the number of independent counterparties, counterparties which belong to the same group as defined in Article 212 of the Solvency II Framework Directive or to the same financial conglomerate as defined in Article 2(14) of the Financial Conglomerate Directive (2002/87/EC) should not be treated as independent counterparties.

SCR.6.7. The class of type 2 exposures covers the exposures which are usually diversified and where the counterparty is likely to be unrated. The class of type 2 exposure should consist of all exposures which are not covered in the spread risk module, are in the scope of the counterparty default risk module and are not of type 1, in particular:

- a) Receivables from intermediaries;
- b) Policy holder debtors;
- c) Residential mortgage loans;
- d) Deposits with ceding undertakings, where the number of single name exposures exceeds 15;
- e) Commitments received by an insurance or reinsurance undertaking which have been called up but are unpaid as referred to in SCR.6.4 (d), where the number of single name exposures exceeds 15.

SCR.6.8. Undertakings may, at their discretion, consider all exposures referred to in points (d) and (e) of SCR.6.6 as type 1 exposures, regardless of the number of single name exposures.

SCR.6.9. Where a letter of credit, a guarantee or an equivalent risk mitigation technique has been provided to fully secure an exposure and this risk mitigation technique meets the requirements of section SCR11.2, then the provider of that letter of credit, guarantee or equivalent risk mitigation technique may be considered as the counterparty on the secured exposure for the purpose of assessing the number of single name exposures.

SCR.6.10. The following credit risks shall not be covered in the counterparty default risk module:

- (a) the credit risk transferred by a credit derivative;
- (b) the credit risk on debt issuance by special purpose vehicles, whether as defined in Article 13(26) of Directive 2009/138/EC or not;
- (c) the underwriting risk of credit and surety ship insurance or reinsurance
- (d) the credit risk on mortgage loans which do not meet the requirements for mortgage loans (see Art.105 (6) of Directive 2009/138/EC39).

SCR.6.11. Investment guarantees on insurance contracts provided to policy holders by a third party and for which the insurance or reinsurance undertaking would be liable should the third party default shall be treated as derivatives in the counterparty default risk module.

Input

SCR.6.12. The following input information is required in relation to type 1 exposures:

<i>Recoverables_i</i>	=	Best estimate recoverables from the reinsurance contract (or SPV) <i>i</i> plus any other debtors arising out of the reinsurance arrangement or SPV securitisation
<i>MarketValue_i</i>	=	The market value of the derivative <i>i</i> in accordance with Article 75 of Directive 2009/138/EC
<i>Collateral_i</i>	=	Risk-adjusted value of collateral in relation to the reinsurance arrangement or SPV securitisation <i>i</i> or in relation to derivative <i>i</i>
<i>Guarantee_i</i>	=	Nominal value of the guarantee, letter of credit, letter of comfort or similar commitment <i>i</i>
<i>MVGuarantee_i</i>	=	The value of the guarantee, letter of credit, letter of comfort or similar commitment <i>i</i> in accordance with Article 75 of Directive 2009/138/EC

SCR^{hyp}	=	The (hypothetical) capital requirement for underwriting or market risk under the condition that the risk mitigating effect of the reinsurance arrangement, SPV or derivative of a particular counterparty is not taken into account in its calculation. These values are only determined for the purpose of the counterparty default risk module
$SCR^{without}$	=	The capital requirements for underwriting risk or market risk without any amendments. These are the requirements as defined in the sections on underwriting risks and market risk. They are available as soon as the calculations of the particular modules have been made
$Rating_i$	=	Credit quality step of counterparty in relation reinsurance, SPV, derivative, guarantee, letter of credit, letter of comfort or similar commitment i
$Solvency\ ratio_i$		The ratio of the eligible amount of own funds to cover the Solvency Capital Requirement

Output

SCR.6.13. The module delivers the following output:

SCR_{def}	=	Capital requirement for counterparty default risk
$nSCR_{def}$	=	Capital requirement for counterparty default risk including the risk absorbing capacity of technical provisions

Calculation

SCR.6.14. The capital requirements for type 1 and type 2 exposures should be calculated separately. A low diversification effect should be allowed in the aggregation of the requirements as follows:

$$SCR_{def} = \sqrt{SCR_{def,1}^2 + 1.5 \cdot SCR_{def,1} \cdot SCR_{def,2} + SCR_{def,2}^2},$$

where

SCR_{def} = Capital requirement for counterparty default risk

$SCR_{def,1}$ = Capital requirement for counterparty default risk of type 1 exposures

$SCR_{def,2}$ = Capital requirement for counterparty default risk of type 2 exposures

SCR.6.15. Additionally, undertakings should determine the capital requirement for counterparty default risk including the risk absorbing capacity of technical provisions $nSCR_{def}$ as the loss in net asset value resulting from a counterparty default loss of the amount SCR_{def} . The result of the scenario should be determined under the condition

that the value of future discretionary benefits can change and that undertakings are able to vary its assumptions in future bonus rates in response to the shock being tested.

SCR.6.2. Calculation of capital requirement for type 1 exposures

SCR.6.16. The main inputs of the counterparty default risk module are the estimated loss-given-default (LGD) of an exposure and the probability of default (PD) of the counterparty. Given probabilities of default and losses-given-default (LGD) of the counterparties in the portfolio of type 1 exposures, the capital requirement for type 1 exposures is calculated as follows:

$$SCR_{def,1} = \begin{cases} 3 \cdot \sqrt{V}, & \text{if } \sqrt{V} \leq 7\% \cdot \sum_i LGD_i \\ 5 \cdot \sqrt{V}, & \text{if } 7\% \cdot \sum_i LGD_i < \sqrt{V} \leq 20\% \sum_i LGD_i \\ \sum_i LGD_i, & \text{if } 20\% \sum_i LGD_i \leq \sqrt{V} \end{cases}$$

where the sum is taken over all independent counterparties with type 1 exposures and LGD_i = Loss-given-default for type 1 exposure of counterparty i

V = Variance of the loss distribution of the type 1 exposures

\sqrt{V} = Standard deviation of the loss distribution of the type 1 exposures

SCR.6.17. The variance of the loss distribution of type 1 exposures shall be equal to the sum of V_{inter} and V_{intra} .

SCR.6.18. V_{inter} shall be equal to the following:

$$V_{inter} = \sum_{(j,k)} \frac{PD_k \cdot (1 - PD_k) \cdot PD_j \cdot (1 - PD_j)}{1.25 \cdot (PD_k + PD_j) - PD_k \cdot PD_j} \cdot TLGD_j \cdot TLGD_k$$

where:

- the sum covers all possible combinations (j,k) of different probabilities of default on single name exposures;
- $TLGD_j$ and $TLGD_k$ denote the sum of losses -given- default on type 1 exposures from counterparties bearing a probability of default PD_j and PD_k respectively .

SCR.6.19. V_{intra} shall be equal to the following:

$$V_{intra} = \sum_j \frac{1.5 \cdot PD_j \cdot (1 - PD_j)}{2.5 - PD_j} \cdot \sum_{PD_j} LGD_i^2$$

where:

- (a) the first sum covers all different probabilities of default on single name exposures
- (b) the second sum covers all single name exposures that have a probability of default equal to PD_j .
- (b) LGD_i denotes the loss-given-default on the single name exposure i .

SCR.6.20. The PD_i denotes the probability of default, regarding a credit exposure i for which a credit assessment by a nominated ECAI is available. The values of PD_i should be set as follows:

Credit quality step	0	1	2	3	4	5	6
Probability of default PD_i	0.002 %	0.01 %	0.05%	0.24%	1.20%	4.2 %	4.2 %

SCR.6.21. In cases where more than one credit quality steps is available for a counterparty, the second-highest credit quality step should be used.

Counterparties without a credit quality step

SCR.6.22. For counterparties  without credit quality steps that meet the following requirements,

- a. are (re)insurance undertakings,
- b. meet their MCR,
- c. the Solvency ratios are determined according to the requirements set out in these specifications (Solvency II ratios),
- d. the Solvency ratios are determined consistently to the scenario under consideration.

the Probability of default (PD), depending on the solvency ratio is determined as follows

Solvency ratio	196% or higher	175%	150%	125%	122%	100%	95%	75% or lower
----------------	----------------	------	------	------	------	------	-----	--------------

PD_i	0.01%	0.05%	0.1%	0.2%	0.24%	0.5%	1.2%	4.2 %
--------	-------	-------	------	------	-------	------	------	-------

SCR.6.23. Where the solvency ratio falls in between the solvency ratios specified above, the value of the probability of default shall be linearly interpolated from the closest solvency ratios and probabilities of default specified in the table above. For solvency ratios lower than 75 %, the probability of default shall be 4.2 %. For solvency ratios higher than 196 %, the probability of default shall be 0.01 %

SCR.6.24. For unrated counterparties that are insurance or reinsurance undertakings and that do not meet their MCR, the probability of default should be 4.2%.

SCR.6.25. The probability of default for unrated banks compliant with the Capital Requirements Directive (2006/48/EC) should be 0.5 %.

SCR.6.26. For all other unrated counterparties, the probability of default should be 4.2%.

Counterparties which belong to the same group

SCR.6.27. If an undertaking has more than several counterparty which are not independent (for example because they belong to one group) then it is necessary to assign a probability of default to the whole set of dependent counterparties. This overall probability of default should be average probability of the counterparties weighted with the corresponding losses given-default.

Banks

SCR.6.28. For unrated counterparties that are credit institutions and financial institutions within the meaning of Article 4(1) and (5) of Directive 2006/48/EC and which meet the requirements of Directive 2006/48/EC the probability of default shall be equal to 0.5 %.

Pooling arrangements

SCR.6.29. Undertakings may consider exposures which belong to different members of the same legal or contractual pooling arrangement as different single name exposures, irrespective of whether the undertaking ceding its risk to the pool is a member of the pool or not.

A “pooling arrangement” is an arrangement between several insurance or reinsurance undertakings, the “pool members”, whereby the pool members agree to share in defined proportions similarly defined insurance risks each pool member has written for its own account. The pool members are jointly liable or severally liable for the insurance risks transferred to the pooling arrangement. For the purpose of this definition:

- the parties insured by pool members are not members to the pooling arrangement;
- a contract including the parties insured as a member to the contract is not a pooling arrangement.

Where the composition of the pool members varies in the context of the same arrangement depending on conditions of this very arrangement, the arrangement shall be unbundled and separate calculations of the Loss Given Default shall be performed for each composition of the pool.

Whether the undertaking which is calculating its counterparty default capital requirement is party to the pooling arrangement or not is determining which exposures should be considered in the application of this regulation.

Pool exposure of **type A**: The undertaking's exposure is ceded to the pooling arrangement or members of the pooling arrangement as part of its contract with the pooling arrangement. The undertaking itself is not a party to the pooling arrangement

Pool exposure of **type B**: The undertaking's exposure is ceded to the pooling arrangement or members of the pooling arrangement as part of its contract with the pooling arrangement. The undertaking itself is a party to the pooling arrangement.

Pool exposure of **type C**: The undertaking's exposure to an external counterparty to the pooling arrangement, due to shared risk that meets the criteria of the pooling arrangement. The undertaking itself is a party to the pooling arrangement.

The probabilities of default of the single name exposure shall be used in accordance with SCR.6.19.-SCR.6.25. for type 1 exposures. The loss given default shall be calculated separately for exposures through a pooling arrangement and for non-pooling exposure. The loss given default is the sum of the loss given default for pooling exposures and non-pooling exposures. The loss given default shall be calculated as follows, depending on the type of pool exposure:

1. Loss given default for pool exposure of type A:

i. For pool exposures of type A which the undertaking considers as a separate single name exposure, the loss given default of a pool member is equal to the loss given default set out in SCR.6.30.. Where the pooling arrangement is jointly liable, this loss given default shall be multiplied by a risk-share factor Q.

ii. There is only one Q-factor for each pooling arrangement, to be calculated as:

$$Q = e^{-\alpha(\min(SR_{pool}, 196\%) - 1)}, \alpha = 0.15$$

Where we denote each pool member which are in scope of application of the 2009/138/EC Directive by the subscript i and any other pool member by the subscript j:

$$SR_{pool} = (1 - P) \times \frac{\sum_i (\text{eligible own funds})_i}{\sum_i [(\text{eligible own funds})_i / SR_i]} + \sum_j P_j \times SR_j$$

where

$P = \sum_j P_j$, P_j denotes the share of risk of pool member j agreed by the pooling arrangement and SR_i and SR_j denotes the solvency ratio of the pool member i and j.

iii. For the calculation of the Q factor , the undertaking shall use the latest available information.

iv. SR_i and SR_j for pool members which are in scope of application of the 2009/138/EC Directive for which a credit assessment by a nominated ECAI is available shall be assigned in accordance with the following table:

Credit quality step	0	1	2	3	4	5	6
---------------------	---	---	---	---	---	---	---

SR _i and SR _j	196%	196%	175%	122%	95%	75%	75%
---	------	------	------	------	-----	-----	-----

- v. SR_i for pool members which are in scope of application of the 2009/138/EC Directive for which a credit assessment by a nominated ECAI is not available shall be assigned the latest available Solvency Ratio.
- vi. Where two or more members of the pooling arrangement belong to the same corporate group they shall be treated as the same single name exposure. In particular, if all the members of the pooling arrangement belong to the same corporate group, they shall be treated as a single name exposure, without application of the Q factor.
- vii. Where the undertaking is ceding risk to a pooling arrangement by the intermediary of a central undertaking, the central undertaking should be considered as part of the pooling arrangement and its share of the risk calculated in this context.

5. Loss given default for pool exposure of type B:

Where the pooling arrangement is jointly liable, the loss for the undertaking (*U*) given default of the counterparty member (*CM*) shall be equal to the following:

$$LGD_{CM} = \max\left(\left(1 - RR_{CM}\right) \times \left(\frac{P_U}{1 - P_{CM}} \times BE_{CM,Pool}^{Net,Internal} + \Delta RM_{U,Pool}^{CM}\right) - F.Collateral\right); 0$$

Where:

- a. P_U denotes the undertaking's share of risk agreed by the pooling arrangement.
- b. P_{CM} denotes the counterparty member's share of risk agreed by the pooling arrangement.
- c. RR_{CM} for a given counterparty member should be equal to:
 - i. 10% if 60 % or more of the assets of this counterparty member are subject to collateral arrangements.
 - ii. 50% otherwise.
- d. $BE_{CM,Pool}^{Net,Internal}$ denotes the best estimates of the liabilities ceded to the counterparty member (CM) in regards to exposure through the pooling

arrangement, net of any reinsurance from external counterparties to the pool.

- e. $\Delta RM_{U,Pool}^{CM}$ denotes the counterparty member's (CM) contribution to the risk-mitigating effect of the pooling arrangement on the underwriting risk of the undertaking (U).
- f. *Collateral* denotes the risk-adjusted value of collateral in relation to the counterparty member of the pooling arrangement.
- g. F denotes the factor to take into account the economic effect of the collateral arrangement in relation to the pooling.

Where members of the pooling arrangement are each only liable up to their respective portion of the obligation covered by the pooling arrangement, the loss for the undertaking (U) given default of the counterparty member (CM) shall be equal to the following:

$$LGD_{CM} = \max(((1 - RR_{CM}) \times (P_{CM} \times BE_{UtoPool}^{Net,Internal} + \Delta RM_{U,Pool}^{CM}) - F.Collateral); 0)$$

Where:

- a. P_{CM} denotes the counterparty member's share of risk agreed by the pooling arrangement.
- b. RR_{CM} for a given counterparty member should be equal to:
 - i. 10% if 60 % or more of the assets of this counterparty member are subject to collateral arrangements.
 - ii. 50% otherwise.
- c. $BE_{UtoPool}^{Net,Internal}$ denotes the best estimate of the liabilities which are ceded to the pooling arrangement by undertaking U, net of any reinsurance from external counterparties to the pool.
- d. $\Delta RM_{U,Pool}^{CM}$ denotes the counterparty member's (CM) contribution to the risk-mitigating effect of the pooling arrangement on the underwriting risk of the undertaking (U).
- e. *Collateral* denotes the risk-adjusted value of collateral in relation to the counterparty member of the pooling arrangement.
- f. F denotes the factor to take into account the economic effect of the collateral arrangement in relation to the pooling arrangement.

6. Loss given default for pool exposure of type C:

The loss for the undertaking (U) given default of the counterparty undertaking external to the pooling arrangement (CE) shall be equal to the following:

$$LGD_{CE} = \max(((1 - RR_{CE}) \times (P_U \times BE_{Pool}^{CE} + \Delta RM_{U,Pool}^{CE}) - F.Collateral); 0)$$

Where:

- a. P_U denotes the undertaking's share of risk agreed by the pooling arrangement.
- b. RR_{CE} for a given external counterparty should be equal to:
 - i. 10% if 60 % or more of the assets of this external counterparty are subject to collateral arrangements.
 - ii. 50% otherwise.
- c. BE_{Pool}^{CE} denotes the best estimates of liabilities ceded to the external counterparty (*CE*) by the pooling arrangement as a whole.
- d. $\Delta RM_{U,Pool}^{CE}$ denotes the external counterparty's (*CE*) contribution to the risk-mitigating effect of the pooling arrangement on the underwriting risk of the undertaking (*U*).
- e. *Collateral* denotes the risk-adjusted value of collateral in relation to the external counterparty of the pooling arrangement.
- f. *F* denotes the factor to take into account the economic effect of the collateral arrangement in relation to the pooling arrangement.

Simplifications for the loss given default for pool exposures of type B and C

1. Best estimate exposure to a counterparty member:

Where $BE_{CM,Pool}^{Net,Internal}$ in paragraph 5 is not known directly, it may be approximated as follows :

$$BE_{CM,Pool}^{Net,Internal} = \frac{P_{CM}}{P_U} \times BE_{U,Pool}^{Net,Internal}$$

Where:

$BE_{U,Pool}^{Net,Internal}$ denotes the undertaking's (*U*) best estimate liabilities towards the pooling arrangement as a whole, net of any reinsurance from external counterparties to the pool.

2. Best estimate exposure to an external counterparty:

Where BE_{Pool}^{CE} in paragraph 6 is not known directly, it may be approximated as follows:

$$BE_{Pool}^{CE} = \frac{1}{P_U} \times BE_{U,Pool}^{CE}$$

Where:

$BE_{U,Pool}^{CE}$ denotes the best estimate liabilities ceded to the external counterparty (*CE*) by the pool, in relation to risks ceded to the pool by the undertaking (*U*).

3. Risk Mitigation exposure to external counterparties:

Where external counterparties provide risk mitigation to the pooling arrangement in proportions equal to their best estimate shares of the pool as in paragraph 6, the following approximation can be used:

$$\Delta RM_{U,Pool}^{CE} = \left(BE_{Pool}^{CE} / \sum_{CE} BE_{Pool}^{CE} \right) \times \Delta RM_{U,Pool}^{All_CEs}$$

Where:

- a. BE_{Pool}^{CE} is the best estimate liabilities ceded by the pooling arrangement to the external counterparty (CE).
- b. $\Delta RM_{Pool}^{All_CEs}$ denotes all external counterparties' (CE) contribution to the risk-mitigating effect of the pooling arrangement on the underwriting risk of the undertaking (U).

4. Grouping of single name exposures

For the purposes of the Quantitative Assessment the loss given default may be calculated for a group of single name exposures. In this case, the group of single name exposures shall be assigned the probability of default on the highest probability of default assigned to a single name exposure included in the group. For each of pooling exposure (of) type A, type B, and type C, there shall be separate groupings.

SCR.6.3.Loss-given-default for risk mitigating contracts

SCR.6.30. The LGD of an exposure is conceptually defined to be the loss of basic own funds which the insurer would incur if the counterparty defaulted.

SCR.6.31. In case of default, typically a part of the exposure can still be collected. In order to allow for the potential recovery of the counterparty, the LGD is amended by a factor $(1 - RR)$ where RR denotes the recovery rate of the counterparty. The recovery rate may be different for reinsurance arrangements and securitisations on one hand and for derivatives on the other hand.

SCR.6.32. For a **reinsurance arrangement or securitisation** i , the loss-given-default LGD_i should be calculated as follows:

$$LGD_i = \max(0; 50\%(\text{Recoverables}_i + RM_{re,i}) - F \cdot \text{Collateral}_i)$$

where

$Recoverables_i$ = Best estimate recoverables from the reinsurance contract (or SPV) i plus any other debtors arising out of the reinsurance arrangement or SPV securitisation

$RM_{re,i}$ = Risk mitigating effect on underwriting risk of the reinsurance arrangement or SPV securitisation i

$Collateral_i$ = Risk-adjusted value of collateral in relation to the reinsurance arrangement or SPV securitisation i .

F = Factor to take into account the economic effect of the collateral arrangement in relation to the reinsurance arrangement or securitisation in case of any credit event related to the counterparty i .

SCR.6.33. The best estimate of the $Recoverables_i$ might be netted with liabilities towards the same legal entity to the extent they could be set off in case of the default of the legal entity. However, if a reinsurance counterparty has tied up an amount for collateralisation commitments (both on and off balance sheet, including commitments) greater than 60% of the assets on its balance sheet, the loss-given-default LGD_i should be calculated as follows:

SCR.6.34.

$$LGD_i = \max(0; 90\%(Recoverables_i + RM_{re,i}) - F \cdot Collateral_i)$$

where

$Recoverables_i$ = Best estimate recoverables from the reinsurance contract (or SPV) i plus any other debtors arising out of the reinsurance arrangement or SPV securitisation

$RM_{re,i}$ = Risk mitigating effect on underwriting risk of the reinsurance arrangement or SPV securitisation i

$Collateral_i$ = Risk-adjusted value of collateral in relation to the reinsurance arrangement or SPV securitisation i .

F = Factor to take into account the economic effect of the collateral arrangement in relation to the reinsurance arrangement or securitisation in case of any credit event related to the counterparty i .

SCR.6.35. For a **derivative** i , the *loss-given-default* LGD_i should be calculated as follows:

$$LGD_i = \max(0; 90\%(MarketValue_i + RM_{fin,i}) - F \cdot Collateral_i)$$

where

$MarketValue_i$ = Value of the derivative i in accordance with Article 75 of Directive 2009/138/EC.

$RM_{fin,i}$ = Risk mitigating effect on market risk of the derivative i

$Collateral_i$ = Risk-adjusted value of collateral in relation to the derivative i .

The best estimate of the $Recoverables_i$ might be netted with liabilities towards the same legal entity to the extent they could be set off in case of the default of the legal entity.

F = Factor to take into account the economic effect of the collateral arrangement in relation to the reinsurance arrangement or securitisation in case of any credit event related to the counterparty i .

SCR.6.36. For a **mortgage loan** i , the loss-given-default LGD_i should be calculated as follows:

$$LGD_i = \max(0; Loan_i - Mortgage_i)$$

where

$Loan_i$ = Value of the mortgage loan i in accordance with Article 75 of Directive 2009/138/EC,

$Mortgage_i$ = Risk-adjusted value of the mortgage in relation to the mortgage loan i ,

Calculation of the Risk-adjusted value of mortgage

SCR.6.37. The risk-adjusted value of mortgage referred to in SCR.6.38 shall be equal to the difference between the value of the residential property held as mortgage, valued in accordance with SCR.6.36, and the adjustment for market risk, as referred to in SCR.6.41.

SCR.6.38. The value of the residential property held as mortgage shall be the market value reduced as appropriate to reflect the results of the monitoring required under the requirements listed below and to take account of any prior claims on the property. (a) the insurance or reinsurance undertaking monitors the value of the property on a frequent basis and at a minimum once every three years. The insurance or reinsurance undertaking carries out more frequent monitoring where the market is subject to significant changes in conditions; (b) the property valuation is reviewed when information available to the insurance or reinsurance undertaking indicates that the value of the property may have declined materially relative to general market prices and that review is external and independent and carried out by a valuer who possesses the necessary qualifications, ability and experience to execute a valuation and who is independent from the credit decision process. For the purposes of (a) and (b), insurance or reinsurance undertakings may use statistical methods to monitor the value of the property and to identify property that needs revaluation. The external, independent valuation of the property shall be the same or less than the market value calculated in accordance with Article 75 of Directive 2009/138/EC.

SCR.6.39. The adjustment for market risk referred to in SCR.6.39 is the difference between the following capital requirements:

- (a) the hypothetical capital requirement for market risk of the insurance or reinsurance undertaking that would apply if the residential property held as mortgage were not included in the calculation; and
- (b) the hypothetical capital requirement for market risk of the insurance or reinsurance undertaking that would apply if the residential property held as mortgage were included in the calculation.

SCR.6.40. For the purpose of SCR.6.40, the currency risk of the residential property held as mortgage shall be calculated by comparing the currency of the residential property against the currency of the corresponding loan.

Calculation of the risk mitigating effect

SCR.6.41. The risk mitigating effects $RM_{re,i}$ and $RM_{fin,i}$ are defined as the difference between the following two capital requirements:

- The (hypothetical) capital requirement for underwriting and market risk under the condition that the risk mitigating effect of the reinsurance arrangement, SPV or derivative of a particular counterparty is not taken into account in its calculation (SCR^{hyp}). These values are only determined for the purpose of the counterparty default risk module.
- The capital requirements for underwriting risk and market risk without any amendments ($SCR^{without}$). These are the requirements as defined in the sections on underwriting risks and market risk. They are available as soon as the calculations of the particular modules have been made.

SCR.6.42. The hypothetical capital requirement in relation to counterparty (i) is determined by a recalculation of the modules which are affected by the risk mitigating contracts with that counterparty. This should be done for life reinsurance and for derivatives as follows:

The scenario outcome should be reassessed assuming that the risk-mitigating contract with counterparty (i) will not provide any compensation for the losses incurred under the scenario.

SCR.6.43. In particular, if a module of the SCR did not allow for the risk mitigating effect of the risk-mitigating contract with counterparty (i) in the calculation of the capital requirement without any amendments, the two capital requirements coincide and $RM_{re,i}$ and $RM_{fin,i}$ are zero.

SCR.6.44. Where a risk mitigation instrument transfers both underwriting risk and market risk, the risk mitigating effect should be given by the aggregation between the risk-mitigating effect in relation to underwriting risk and the risk-mitigating effect in relation to market risk.

SCR.6.45. For non-life reinsurance, the following method should be applied. If the reinsurance treaties with a counterparty affect only one non-life line of business, then the difference $SCR_{nl}^{hyp} - SCR_{nl}^{without}$ should be approximated by the following term:

$$\sqrt{\left(NL_{cat}^{hyp} - NL_{cat}^{without}\right)^2 + \left(3\sigma_{(prem,lob)} \cdot \left(P_{lob}^{hyp} - P_{lob}^{without}\right)\right)^2 + \left(3\sigma_{(res,lob)} \cdot recoverables\right)^2} + 9\sigma_{(prem,lob)} \cdot \left(P_{lob}^{hyp} - P_{lob}^{without}\right) \cdot \sigma_{(res,lob)} \cdot recoverables$$

where

$\left(NL_{cat}^{hyp} - NL_{cat}^{without}\right)$ = Counterparty's share of CAT losses

$\left(P_{lob}^{hyp} - P_{lob}^{without}\right)$ = Reinsurance premium of the counterparty in the affected line of business

recoverables = Reinsurance recoverables in relation to the counterparty in the affected line of business

$\sigma_{(prem,lob)}$ = Standard deviation for premium risk in the affected line of business as used in the premium and reserve risk sub-module

$\sigma_{(res,lob)}$ = Standard deviation for reserve risk in the affected line of business as used in the premium and reserve risk sub-module

SCR.6.46. If the reinsurance treaties with a counterparty affect more than one non-life line of business, the terms defined above for each line of business can be summed up to determine an approximation for $SCR_{nl}^{hyp} - SCR_{nl}^{without}$.

Where a risk mitigation instrument transfers both underwriting risk and market risk, the risk mitigating effect should be given by the aggregation (assuming a correlation factor of 0.25) between the risk-mitigating effect in relation to underwriting risk and the risk-mitigating effect in relation to market risk.

SCR.6.4.Loss-given-default for type 1 exposures other than risk mitigating contracts

SCR.6.47. For cash at bank, deposits with ceding institutions and unpaid but called up capital or for receivables from intermediaries or policyholder debtors the loss-given-default should be the value of the corresponding asset in accordance with Article 75 of Directive 2009/138/EC.

SCR.6.48. For guarantees, letters of credit, letters of comfort and other commitment which depend on the credit standing of a counterparty the loss-given default should be the difference between their nominal value and their value in accordance with Article 75 of Directive 2009/138/EC.

SCR.6.49. If in relation to a counterparty where more than one type 1 exposures exist, then the loss-given-default for this counterparty should be the sum of the losses-given-default of the single exposures assignment.

SCR.6.5. Calculation of capital requirement for type 2 exposures

SCR.6.50. The capital requirement for counterparty default risk of type 2 exposures is determined as the result of a pre-defined scenario:

$$SCR_{def,2} = \Delta BOF / \text{type 2 counterparty default shock}$$

SCR.6.51. The capital requirement for counterparty default risk on type 2 exposures shall be equal to the loss in the basic own funds that would result from an instantaneous decrease in value of type 2 exposures. by the following amount:

$$0.9 \cdot LGD_{receivables>3months} + 0.15 \cdot \sum_i LGD_i$$

where:

- (a) $LGD_{receivables>3months}$ denote the total losses-given-default on all receivables from intermediaries which have been due for more than three months
- (b) the sum is taken on all type 2 exposures other than receivables from intermediaries which have been due for more than three months;
- (c) LGD_i denotes the loss-given-default on the type2 exposure i .

Additional information on mortgage loans treated as type 2 exposures

SCR.6.52. Retail loans secured by mortgages on residential property (mortgage loans) shall be treated as type 2 exposures under the counterparty default risk provided the following requirements are met:

- (1) The exposure shall be either to a natural person or persons or to a small or medium sized enterprise.
- (2) The exposure shall be one of a significant number of exposures with similar characteristics such that the risks associated with such lending are substantially reduced.
- (3) The total amount owed to the insurance or reinsurance undertaking and, where relevant, to all related undertakings within the meaning of Article 212(1)(b) and 212(2) of Directive 2009/138/EC, including any exposure in default, by the counterparty or other connected third party, shall not, to the knowledge of the insurance or reinsurance undertaking, exceed EUR 1 million. The insurance or reinsurance undertaking shall take reasonable steps to acquire this knowledge.
- (4) The residential property is or shall be occupied or let by the owner.
- (5) The value of the property does not materially depend upon the credit quality of the borrower.

- (6) The risk of the borrower does not materially depend upon the performance of the underlying property, but on the underlying capacity of the borrower to repay the debt from other sources, and as a consequence, the repayment of the facility does not materially depend on any cash flow generated by the underlying property serving as collateral. For those other sources, the insurance or reinsurance undertaking shall determine maximum loan-to-income ratio as part of their lending policy and obtain suitable evidence of the relevant income when granting the loan.
- (7) The following requirements on legal certainty shall be met:
- (a) a mortgage or charge is enforceable in all jurisdictions which are relevant at the time of the conclusion of the credit agreement and shall be properly filed on a timely basis;
 - (b) all legal requirements for establishing the pledge have been fulfilled;
 - (c) the protection agreement and the legal process underpinning it enable the insurance or reinsurance undertaking to realise the value of the protection within a reasonable timeframe.

SCR.6.6. Treatment of risk mitigation techniques

SCR.6.53. The counterparty default risk module should take into account techniques to mitigate default risk like collaterals or netting of receivables with liabilities. Allowance should be made as follows:

Collaterals

SCR.6.54. If a collateral meets the two following requirements:

- a. The legal mechanism by which collateral is pledged or transferred should ensure that the undertaking has the right to liquidate or take legal possession of the collateral, in a timely manner, in case of any default event related to the counterparty ("the counterparty requirement");
- b. Where applicable, the legal mechanism by which collateral is pledged or transferred should ensure that the undertaking has the right to liquidate or take possession of the collateral, in a timely manner, in case of any default event related to a third party custodian holding the collateral ("the custodian requirement"),

then the loss-given-default (in case of a type 1 exposure) or the value of the exposure (in case of a type 2 exposure) may be reduced by the risk-adjusted value of the collateral.

The risk-adjusted value of the collateral should be calculated as follows, in case both the counterparty requirement and the custodian requirement are met or in case full ownership of the risk-adjusted value of the collateral is transferred to the insurance undertaking :

$$\text{Collateral} = \text{MarketValue}_{\text{Collateral}} - \text{MktRisk}_{\text{Collateral}}$$

where

$\text{MarketValue}_{\text{Collateral}}$ = Market value of the collateral assets

$\text{MktRisk}_{\text{Collateral}}$ = Adjustment for market risk.

SCR.6.55. If the collateral is held by or deposited  in a third party custodian and the collateral only meets the counterparty requirement, then the risk-adjusted value of the collateral should be calculated as follows:

$$\text{Collateral} = 0.9 \cdot (\text{MarketValue}_{\text{Collateral}} - \text{MktRisk}_{\text{Collateral}}),$$

where

$\text{MarketValue}_{\text{Collateral}}$ = Market value of the collateral assets

$\text{MktRisk}_{\text{Collateral}}$ = Adjustment for market risk.

SCR.6.56. The adjustment for market risk is the difference between the following capital requirements:

- a. the hypothetical capital requirement for market risk of the insurance and reinsurance undertaking that would apply if the assets held as collateral are not included in the calculation; and
- b. the hypothetical capital requirement for market risk of the insurance and reinsurance undertaking that would apply if the assets held as collateral are included in the calculation.

SCR.6.57. If a collateral does not meet the "counterparty requirement", then it should not be taken into account as a risk mitigant.

SCR.6.58. For the calculation of the adjustment for market risk, the reduction of the market value of the collateral according to the equity, property, credit spread and currency risk sub-module should be determined and aggregated according to the correlation matrix of the market risk module.

SCR.6.59. For the calculation of the currency risk sub-module, the currency of the collateral is compared to the currency of the secured credit exposure. If the collateral assets are bank deposits which are not subject to the credit spread risk, the adjustment should be increased by the capital requirement for counterparty default risk of the deposits.

Segregated assets

SCR.6.60. Where, and to the extent that, the liabilities of the counterparty are covered by strictly segregated assets under arrangements which meet the requirements set out in section SCR.11 on financial risk mitigation techniques, the segregated assets should be treated like collaterals in the calculation of the counterparty default risk module.

Letters of credit

SCR.6.61. If a letter of credit is provided to secure a credit exposure and the arrangement meets the requirement defined in section SCR.11 on financial risk mitigation techniques, then the counterparty of the credit exposure can be replaced by the provider of the letter of credit in the calculation of the counterparty default risk module. This replacement affects the probability of default that is taken into account in the calculation as well as the assessment whether the counterparty is independent from other counterparties.

SCR.6.62. A letter of credit should not be taken into account in the calculation of the counterparty default risk module if it is classified as ancillary own funds.

Netting

SCR.6.63. The loss-given-default (in case of a type 1 exposure) or the value of the exposure (in case of a type 2 exposure) may be netted with liabilities towards the same legal entity to the extent they could be set off in case of default of the legal entity. The general requirement defined in sections SCR.11 and SCR.12 should be met in relation to netting if it is taken into account in the calculation. In particular, if the legal situation in relation to netting is unclear, then no netting should be taken into account. No netting should be allowed for if the liabilities are expected to be met before the credit exposure is cleared.

SCR.6.7.Simplifications for risk mitigating effects and risk adjusted values of risk mitigating contracts

Simplifications for the calculation of loss given default for risk-mitigating contracts (type 1 exposure)

SCR.6.64. Undertakings may use simplified calculations for the risk-mitigating effect on underwriting and market risks of a reinsurance arrangement, securitisation or derivative. These simplifications should only be used if the following conditions are met:

- there are no indications that the simplification significantly misestimates the risk mitigating effect.
- the result of the sophisticated calculation is not easily available.

In this case the simplifications may be calculated as the difference between the following capital requirements:

- a) the sum of the hypothetical capital requirement for the sub-modules of underwriting and market risk of the insurance or reinsurance undertaking affected by the risk-mitigating instrument, if the reinsurance arrangement, securitisation or derivative did not exist;
- b) the sum of the capital requirements for the sub-modules of underwriting and market risk of the insurance or reinsurance undertaking affected by the risk-mitigating instrument.

SCR.6.65. Simplified calculation of the risk mitigating effect **for reinsurance arrangements or securitisation:**

- (1) The risk-mitigating effect on underwriting risk of a reinsurance arrangement or securitisation i may be calculated as follows:

$$RM_{re,all} \cdot \frac{Recoverables_i}{Recoverables_{all}}$$

where

- a) $RM_{re,all}$ denotes the risk mitigating effect on underwriting risk of the reinsurance arrangements and securitisations for all counterparties calculated in accordance with paragraph 2,
 - b) $Recoverables_i$ denotes the best estimate of amounts recoverable from the reinsurance arrangement or securitisation and the corresponding debtors for counterparty i and $Recoverables_{all}$ denotes the best estimate of amounts recoverable from the reinsurance arrangements and securitisations and the corresponding debtors for all counterparties.
- (2) The risk mitigating effect on underwriting risk of the reinsurance arrangements and securitisations for all counterparties referred to in paragraph 1 (a) is the difference between the following capital requirements:
- a) the hypothetical capital requirement for underwriting of the insurance or reinsurance undertaking if none of the reinsurance arrangements and securitisations exist;
 - b) the capital requirements for underwriting risk of the insurance or reinsurance undertaking.

SCR.6.66. The risk-mitigating effect on underwriting risk j of a proportional reinsurance arrangement from counterparty i may be calculated as follows:

$$\frac{Recoverables_i}{BE - Recoverables_{all}} \cdot SCR_j$$

where

- a) BE denotes the best estimate of obligations gross of the amounts recoverable,
- b) $Recoverable_{si}$ denotes the best estimate of amounts recoverable from the reinsurance arrangement and the corresponding debtors for counterparty i ,
- c) $Recoverables_{all}$ denotes the best estimate of amounts recoverable from the reinsurance arrangements and the corresponding debtors for all counterparties
- d) SCR_j denotes the capital requirements for underwriting risk j of the insurance or reinsurance undertaking.

SCR.6.67. A simplified calculation can be used for the **risk adjusted value of collateral** to take into account the economic effect of the collateral. If it is proportionate to the nature, scale and complexity of the risks inherent in the collateral arrangement that meets both the counterparty and the custodian requirements a simplification as follows can be applied:

$$\text{Collateral} = 0.85 \cdot \text{MarketValue}_{\text{Collateral}}$$

Where the collateral is held by or deposited with a third party custodian and the collateral only meets the counterparty requirement, a simplification as follows can be applied:

$$\text{Collateral} = 0.75 \cdot \text{MarketValue}_{\text{Collateral}}$$

DRAFT

SCR.7. SCR Life underwriting risk module

SCR.7.1. Structure of the life underwriting risk module

SCR.7.1. This module covers the risk arising from the underwriting of life insurance, associated with both the perils covered and the processes followed in the conduct of the business.

SCR.7.2. The scope of the life underwriting risk module includes all the life insurance and reinsurance obligations as defined in the subsection V.2.1 on segmentation with the exception of SLT health insurance obligations. In particular, annuities stemming from non-life insurance contracts are in the scope of the module unless the contract was classified as health insurance.

SCR.7.3. The calculations of capital requirements in the life underwriting risk module are based on specified scenarios. General guidance about the interpretation of the scenarios can be found in subsection SCR.1.1.

Description

SCR.7.4. The life underwriting risk module consists of seven sub-modules for mortality risk, longevity risk, disability/morbidity risk, lapse risk, expense risk, revision risk and catastrophe risk.

Input

SCR.7.5. The following input information is required:

$Life_{rev}$	=	Capital requirement for revision risk
$Life_{mort}$	=	Capital requirement for mortality risk
$Life_{long}$	=	Capital requirement for longevity risk
$Life_{dis}$	=	Capital requirement for disability/morbidity risk
$Life_{lapse}$	=	Capital requirement for lapse risk
$Life_{exp}$	=	Capital requirement for expense risk
$Life_{CAT}$	=	Capital requirement for catastrophe risk
$nLife_{mort}$	=	Capital requirement for mortality risk including the loss-absorbing capacity of technical provisions
$nLife_{long}$	=	Capital requirement for longevity risk including the loss-absorbing capacity of technical provisions
$nLife_{dis}$	=	Capital requirement for disability/morbidity risk including the loss-absorbing capacity of technical provisions

- $nLife_{lapse}$ = Capital requirement for lapse risk including the loss-absorbing capacity of technical provisions
- $nLife_{exp}$ = Capital requirement for expense risk including the loss-absorbing capacity of technical provisions
- $nLife_{CAT}$ = Capital requirement for catastrophe risk including the loss-absorbing capacity of technical provisions

Output

SCR.7.6. The module delivers the following output:

- SCR_{Life} = Capital requirement for life underwriting risk
- $nSCR_{Life}$ = Capital requirement for life underwriting risk including the loss absorbing capacity of technical provisions

Calculation

SCR.7.7. The capital requirement for life risk is derived by combining the capital requirements for the life sub-risks using a correlation matrix as follows:

$$SCR_{life} = \sqrt{\sum_{r,c} CorrLife_{r,c} \cdot Life_r \cdot Life_c}$$

where

- $CorrLife_{r,c}$ = The entries of the correlation matrix $CorrLife$
- $Life_r, Life_c$ = Capital requirements for individual life sub-risks according to the rows and columns of correlation matrix $CorrLife$

and where the correlation matrix $CorrLife$ is defined as follows:

	Mortality	Longevity	Disability	Lapse	Expenses	Revision	CAT
Mortality	1						
Longevity	-0.25	1					
Disability	0.25	0	1				
Lapse	0	0.25	0	1			
Expenses	0.25	0.25	0.5	0.5	1		
Revision	0	0.25	0	0	0.5	1	
CAT	0.25	0	0.25	0.25	0.25	0	1

SCR.7.8. The net capital requirement for life risk is determined as follows:

$$nSCR_{life} = \sqrt{\sum_{rxc} CorrLife_{r,c} \cdot nLife_r \cdot nLife_c}$$

where $nLife_{rev}$ is defined to be equal to $Life_{rev}$

SCR.7.2.Life_{mort} mortality risk

Description

SCR.7.9. Mortality risk is the risk of loss, or of adverse change in the value of insurance liabilities, resulting from changes in the level, trend, or volatility of mortality rates, where an **increase** in the mortality rate leads to an increase in the value of insurance liabilities.

SCR.7.10. The increase in mortality rates shall only apply to those insurance policies for which an increase in mortality rates leads to an increase in technical provisions without the risk margin, taking into account the following:

1. multiple insurance policies in respect of the same insured person may be treated as if they were one insurance policy;
2. where the calculation of technical provisions is based on groups of policies, the identification of the policies for which technical provisions increase under an increase of mortality rates may also be based on those groups of policies instead of single policies, provided that it would give approximately the same result.

With regard to reinsurance policies, the identification of the policies for which technical provisions increase under an increase of mortality rates shall apply to the underlying insurance policies only and shall be carried out in accordance with SCR.7.10.

SCR.7.11. The capital requirement should be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous permanent increase in the mortality rates used for the calculation of technical provisions.

SCR.7.12. Where (re)insurance obligations provide benefits both in e of death and survival and the death and survival benefits are contingent on the life of the same insured person, these obligations do not need to be unbundled. For these contracts the

mortality scenario can be applied fully allowing for the netting effect provided by the ‘natural’ hedge between the death benefits component and the survival benefits component (note that a floor of zero applies at the level of contract if the net result of the scenario is favourable to the (re)insurer).

Input

SCR.7.13. No specific input data is required for this module.

Output

SCR.7.14. The module delivers the following output:

$Life_{mort}$ = Capital requirement for mortality risk

$nLife_{mort}$ = Capital requirement for mortality risk including the loss-absorbing capacity of technical provisions

Calculation

SCR.7.15. The capital requirement for mortality risk is defined as the result of a mortality scenario defined as follows:

$$Life_{mort} = (\Delta BOF | mortshock)$$

where

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

$mortshock$ = An instantaneous permanent increase of 15%  mortality rates used for the calculation of technical provisions.

SCR.7.16. The mortality scenario should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.7.17. Additionally, the result of the scenario should be determined under the condition that the value of future discretionary benefits can change and that the undertaking is able to vary its assumptions in future bonus rates in response to the shock being applied. The resulting capital requirement is $nLife_{mort}$.

Simplification

SCR.7.18. The following simplification may be used provided the following conditions are met:

- The simplification is proportionate to the nature, scale and complexity of the risks that the undertaking faces.
- The standard calculation of the mortality risk sub-module is an undue burden for the undertaking.

SCR.7.19. The capital requirement for mortality risk according to the simplified calculation is as follows:

$$SCR_{mortality} = 0.15 \cdot CAR \cdot q \cdot \sum_{k=1}^n \left(\frac{1-q}{1+i_k} \right)^{k-0.5}$$

where, with respect to insurance and reinsurance policies with a positive capital at risk;

- *CAR* denotes the total positive capital at risk, meaning the sum, in relation to each contract, of the higher of zero and the difference between the following amounts:
 - (i) the sum of:
 - the amount that the insurance or reinsurance undertaking would currently pay in the event of the death of the persons insured under the contract after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles; and
 - the expected present value of amounts not covered in the previous indent that the undertaking would pay in the future in the event of the immediate death of the persons insured under the contract after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles;
 - (ii) the best estimate of the corresponding obligations after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles;
- *q* is the expected average death rate over the next year (weighted by the sum assured) of the undertaking's portfolio,
- *n* denotes the modified duration in years of payments payable on death included in the best estimate projection
- *i_k* denotes the annualized spot rate for maturity *k* of the relevant basic risk-free interest rate term structure

SCR.7.3.Life_{long} longevity risk

Description

SCR.7.20. Longevity risk is associated with the risk of loss, or of adverse change in the value of insurance liabilities, resulting from changes in the level, trend, or volatility of

mortality rates, where a **decrease** in the mortality rate leads to an increase in the value of insurance liabilities.

The decrease in mortality rates shall only apply to those insurance policies for which a decrease in mortality rates leads to an increase in technical provisions without the risk margin, taking into account the following:

- (a) multiple insurance policies in respect of the same insured person may be treated as if they were one insurance policy;
- (b) where the calculation of technical provisions is based on groups of policies, the identification of the policies for which technical provisions increase under a decrease of mortality rates may also be based on those groups of policies instead of single policies, provided that it would give approximately the same result.

With regard to reinsurance obligations, the identification of the policies for which technical provisions increase under a decrease of mortality rates shall apply to the underlying insurance policies only and shall be carried out in accordance with SCR.7.20.

SCR.7.21. The capital requirement should be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous permanent decrease in the mortality rates used for the calculation of technical provisions.

SCR.7.22. Where (re)insurance obligations provide benefits both in case of death and survival and the death and survival benefits are contingent on the life of the same insured person(s), these obligations do not need to be unbundled. For these contracts the longevity scenario can be applied fully allowing for the netting effect provided by the 'natural' hedge between the death benefits component and the survival benefits component (note that a floor of zero applies at the level of contract if the net result of the scenario is favourable to the (re)insurer).

Input

SCR.7.23. No specific input data is required for this module.

Output

SCR.7.24. The module delivers the following output:

$Life_{long}$ = Capital requirement for longevity risk

$nLife_{long}$ = Capital requirement for longevity risk including the loss-absorbing capacity of technical provisions

Calculation

SCR.7.25. The capital requirement for longevity risk is defined as a result of a longevity scenario as follows:

$$Life_{long} = (\Delta BOF | longevityshock)$$

where

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

$longevityshock$ = An instantaneous permanent decrease of 20% in mortality rates used for the calculation of technical provisions

SCR.7.26. The longevity scenario should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.7.27. Additionally, the result of the scenario should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being applied. The resulting capital requirement is $nLife_{long}$.

Simplification

SCR.7.28. The following simplification may be used provided the following conditions are met:

- The simplification is proportionate to the nature, scale and complexity of the risks that the undertaking faces.
- The standard calculation of the longevity risk sub-module is an undue burden for the undertaking.

SCR.7.29. The capital requirement for longevity risk according to the simplified calculation can be taken as the following:

$$SCR_{longevity} = 0.2 \cdot q \cdot n \cdot 1.1^{(n-1)/2} \cdot BE_{long}$$

where, with respect to the policies contingent on longevity risk;

- BE_{long} is the best estimate for contracts subject to longevity risk,
- q denotes expected average death rate over the next year (weighted by the sum assured) of the undertaking's portfolio,
- n denotes the modified duration in years of the payments to beneficiaries included in the best estimate projection

SCR.7.4.Life_{dis} disability-morbidity risk

Description

SCR.7.30. Disability-morbidity risk is the risk of loss, or of adverse changes in the value of insurance liabilities, resulting from changes in the level, trend or volatility of disability and morbidity rates.

SCR.7.31. It is applicable for (re)insurance obligations contingent on a definition of disability and disability. However it can be expected that the majority of (re)insurance obligations for which disability-morbidity risk is applicable will be covered by the health module rather than by the life underwriting module. This sub-module of the life underwriting risk module is therefore likely to be applicable only in cases where it is not appropriate to unbundle contracts.

SCR.7.32. The (re)insurance obligations may be structured such that, upon the diagnosis of a disease or in case the policyholder is unable to pursue professional activity as a result of sickness or disability, recurring payments are triggered. These payments may continue until the expiry of some defined period of time or until either the recovery or death of the policyholder. In the latter case, the (re)insurance undertaking is also exposed to the risk that the policyholders receives the payments for longer than anticipated i.e. that claim termination rates are lower than anticipated (recovery risk).

Input

SCR.7.33. No specific input data is required for this module.

Output

SCR.7.34. The module delivers the following output:

$Life_{dis}$ = Capital requirement for disability-morbidity risk

$nLife_{dis}$ = Capital requirement for disability risk including the loss-absorbing capacity of technical provisions

Calculation

SCR.7.35. The capital requirement for disability risk is defined as the result of a disability scenario as follows:

$$Life_{dis} = (\Delta BOF | disshock)$$

where

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

$Disshock$ = A combination of the following instantaneous changes

applied to each policy where the payment of benefits (either lump sum or ) is contingent on disability risk:

- An increase of 35% in disability and morbidity rates which are used in the calculations of technical provisions to reflect the disability and morbidity experience in the following 12 months;
- An increase of 25% in disability and morbidity rates which are used in the calculations of technical provisions to reflect the disability and morbidity experience after the following 12 months;
- a decrease of 20% in morbidity/disability recovery rates used in the calculation of technical provisions in respect of the following 12 months and for all years thereafter.

SCR.7.36. The disability-morbidity scenario should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.7.37. Additionally, the result of the scenario should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being applied. The resulting capital requirement is $nLife_{dis}$.

Simplification

SCR.7.38. The following simplification may be used provided the following conditions are met:

- The simplification is proportionate to the nature, scale and complexity of the risks that the undertaking faces.
- The standard calculation of the disability-morbidity risk sub-module is an undue burden for the undertaking.

SCR.7.39. The capital requirement for disability-morbidity risk according to the simplified calculation is as follows:

$$SCR_{disability-morbidity} = \begin{cases} 0.35 \cdot CAR_1 \cdot d_1 \\ + 0.25 \cdot 1.1^{(n-3)/2} \cdot (n-1) \cdot CAR_2 \cdot d_2 \\ + 0.2 \cdot 1.1^{(n-1)/2} \cdot t \cdot n \cdot BE_{dis} \end{cases}$$

where;

- CAR_1 denotes the total capital at risk, meaning the sum, in relation to each contract, of the higher of zero and the difference between the following amounts:
 - (i) the sum of:
 - the amount that the insurance or reinsurance undertaking would currently pay in the event of the death or disability of the persons insured under the contract after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles; and
 - the expected present value of amounts not covered in the previous indent that the undertaking would pay in the future in the event of the immediate death or disability of the persons insured under the contract after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles;
 - (ii) the best estimate of the corresponding obligations after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles;
- (a) CAR_2 denotes the total capital at risk as defined in letter (a) after 12 months;
- (b) d_1 denotes the expected average disability-morbidity rate during the following 12 months respectively weighted by the sum insured;
- (c) d_2 denotes the expected average disability-morbidity rate in the 12 months after the following 12 months weighted by the sum insured;
- (d) n denotes the modified duration of the payments on disability-morbidity included in the best estimate;
- (e) t denotes the expected termination rates during the following 12 months;
- (f) BE_{dis} denotes the best estimate of obligations subject to disability-morbidity risk

SCR.7.5.Life_{lapse} lapse risk

Description

SCR.7.40. Lapse risk is the risk of loss or adverse change in liabilities due to a change in the expected exercise rates of policyholder options. The relevant options are all legal or contractual policy holder rights to fully or partly terminate, surrender, decrease, restrict or suspend insurance cover or permit the insurance policy to lapse. Where a right allows the full or partial establishment, renewal, increase, extension or resumption of insurance or reinsurance cover, the change in the option exercise rate

shall be applied to the rate that the right is not exercised. In relation to reinsurance contracts the relevant policyholder options shall cover:

- (a) the rights of the policyholders of the reinsurance contracts;
- (b) the rights of the policyholders of the insurance contracts underlying the reinsurance contracts;
- (c) where the reinsurance contracts covers insurance or reinsurance contracts that will be written in the future, the right of the potential policy holders not to conclude those insurance or reinsurance contracts.

SCR.7.41. In the following, the term “lapse” is used to denote all these policyholder options.

Input

SCR.7.42. No specific input data is required for this module.

Output

SCR.7.43. The module delivers the following output:

- $Life_{lapse}$ = Capital requirement for lapse risk
- $nLife_{lapse}$ = Capital requirement for lapse risk including the loss-absorbing capacity of technical provisions

Calculation

SCR.7.44. The capital requirement for lapse risk should be calculated as follows:

If , $\max(nLapse_{down}; nLapse_{up}; nLapse_{mass}) = nLapse_{down}$

then $Lapse = Lapse_{down}$ and $nLapse = nLapse_{down}$;

otherwise, if $\max(nLapse_{down}; nLapse_{up}; nLapse_{mass}) = nLapse_{up}$

then $Lapse = Lapse_{up}$ and $nLapse = nLapse_{up}$;

otherwise, $Lapse = Lapse_{mass}$ and $nLapse = nLapse_{mass}$.

where

- $Life_{lapse}$ = Capital requirement for lapse risk
- $Lapse_{down}$ = Capital requirement for the risk of a permanent decrease of the rates of lapsation
- $Lapse_{up}$ = Capital requirement for the risk of a permanent increase of the rates of lapsation
- $Lapse_{mass}$ = Capital requirement for the risk of a mass lapse event
- $nLife_{lapse}$ = Capital requirement for lapse risk including the loss-absorbing capacity of technical provisions

- $nLapse_{down}$ = Capital requirement for the risk of a permanent decrease of the rates of lapsation, including the loss-absorbing capacity of technical provisions
- $nLapse_{up}$ = Capital requirement for the risk of a permanent increase of the rates of lapsation, including the loss-absorbing capacity of technical provisions
- $nLapse_{mass}$ = Capital requirement for the risk of a mass lapse event, including the loss-absorbing capacity of technical provisions

SCR.7.45. The capital requirement for the risk of a permanent decrease of the rates of lapsation should be calculated as follows:

$$Lapse_{down} = \Delta BOF | lapseshock_{down},$$

where

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

$lapseshock_{down}$ = Instantaneous permanent decrease of 50% in the  assumed option exercise rates of the relevant options in all future years. However, the resulting decreased option exercise rates, following the application of the instantaneous permanent decrease of 50 %, shall not exceed 20 percentage points. The decrease in option exercise rates shall only apply to those relevant options for which the exercise of the option would result in a decrease of technical provisions without the risk margin.

SCR.7.46. The capital requirement for the risk of a permanent increase of the rates of lapsation should be calculated as follows:

$$Lapse_{up} = \Delta BOF | lapseshock_{up},$$

where

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions) 

$lapseshock_{up}$ = Instantaneous permanent increase of 50% in the assumed option exercise rates of the relevant options in all future years. However, the resulting increased option exercise rates (expressed as percentages), following the application of the instantaneous permanent increase of 50 %, shall not exceed 100%. The increase in option exercise rates shall only apply to those relevant options for which the exercise of the option would result in an increase of technical provisions without the risk margin.

SCR.7.47. Therefore, the shocked option exercise rate should be restricted as follows:

$$R_{up}(R) = \min(150\% \cdot R; 100\%) \text{ and}$$

$$R_{down}(R) = \max(50\% \cdot R; R - 20\%),$$

where

R_{up} = shocked option exercise rate in *lapseshock_{up}*

R_{down} = shocked option exercise rate in *lapseshock_{down}*

R = option exercise rate before shock

SCR.7.48. The capital requirement for the risk of a mass lapse event *Lapse_{mass}* should be calculated as follows:

$$Lapse_{mass} = \Delta BOF | lapseshock_{mass},$$

where

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

lapseshock_{mass} = The combination of the following instantaneous changes:

- the discontinuance of 70% of the insurance policies falling within Article 2(3)(b)(iii) and (iv) of Directive 2009/138/EC, for which discontinuance would result in an increase of technical provisions without the risk margin and where the policy holder is either:
 - not a natural person and discontinuance of the policy is not subject to approval by the beneficiaries of the pension fund; or
 - a natural person acting for the benefit of the beneficiaries under those policies, but excluding policies in respect of which there is a family relationship between that natural person and the beneficiaries, and policies effected for private estate planning or inheritance purposes in circumstances where the number of beneficiaries under the policy does not exceed 20;
- the discontinuance of 40% of the insurance policies other than those falling within point (a) for which discontinuance would result in an increase of technical provisions without the risk margin.

210

- where reinsurance contracts cover insurance or reinsurance contracts that will be written in the future, the decrease of 40% of the number of those future insurance or reinsurance contracts used in the calculation of technical provisions.

SCR.7.49. 'discontinuance' means surrender, lapse without value, making a contract paid-up, automatic non-forfeiture provisions or exercising other discontinuity options or not exercising continuity options.

SCR.7.50. The lapse scenarios should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.7.51. Additionally, the result of the scenarios should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being applied. The resulting capital requirement is $nLife_{lapse}$.

SCR.7.52. Notwithstanding the requirement to use the larger of capital requirements as described in paragraph SCR7.45, where the largest of these capital requirements and the largest of the corresponding capital requirements calculated in accordance with section SCR.2 on the Adjustment for the Loss Absorbency capacity of Technical provisions and Deferred taxes are not based on the same scenario, the capital requirement for lapse risk shall be the capital requirement referred to in paragraph SCR 7.45 for which the underlying scenario results in the largest corresponding capital requirement calculated in accordance with SCR.2 on the Adjustment for the Loss Absorbency capacity of Technical provisions and Deferred taxes.

Simplifications

Factor-based formula for scenario effect

SCR.7.53. A simplified calculation of $Lapse_{down}$ and $Lapse_{up}$ may be made if the following conditions are met:

- The simplified calculation is proportionate to nature, scale and complexity of the risk.
- The quantification of the scenario effect defined above would be an undue burden for the undertaking.

SCR.7.54. The simplified calculations are defined as follows:

$$Lapse_{down} = 50\% \cdot I_{down} \cdot n_{down} \cdot S_{down}$$

and

$$Lapse_{up} = 50\% \cdot l_{up} \cdot n_{up} \cdot S_{up} ,$$

where

- $l_{down}; l_{up}$ = estimate of the average rate of lapsation of the policies with a negative/positive surrender strain, subject to a minimum rate of lapsation of 40% in case of negative surrender strain and a minimum of 67% in case of positive surrender strain
- $n_{down}; n_{up}$ = average period (in years), weighted by surrender strains, over which the policy with a negative/positive surrender strain runs off
- $S_{down}; S_{up}$ = sum of negative/positive surrender strains

SCR.7.6.Life_{exp} expense risk

Description

SCR.7.55. Expense risk arises from the variation in the expenses incurred in servicing insurance and reinsurance contracts.

Input

SCR.7.56. No specific input data is required for this module.

Output

SCR.7.57. The module delivers the following output:

- $Life_{exp}$ = Capital requirement for expense risk
- $nLife_{exp}$ = Capital requirement for expense risk including the loss-absorbing capacity of technical provisions

Calculation

SCR.7.58. The capital requirement for expense risk is determined as follows:

$$Life_{exp} = \Delta BOF | expshock$$

where:

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

$expshock$ = A combination of the following instantaneous permanent changes:

- an increase of 10 % in the amount of expenses taken into account in the calculation of technical provisions;
- an increase of 1 percentage point to the expense inflation rate (expressed as a percentage) used for

the calculation of technical provisions.

SCR.7.59. An expense payment should not be included in the scenario, if its amount is already fixed at the valuation date (for instance agreed payments of acquisition provisions). For policies with adjustable expense loadings the analysis of the scenario should take into account realistic management actions in relation to the loadings.

SCR.7.60.

With regard to reinsurance obligations, insurance and reinsurance undertakings shall apply these changes to their own expenses and, where relevant, to the expenses of the ceding undertakings.

SCR.7.61. The expense scenario should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.7.62. Additionally, the result of the scenario should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being applied. The resulting capital requirement is $nLife_{exp}$.

Simplification

SCR.7.63. The following simplification may be used provided the following conditions are met:

- The simplification is proportionate to the nature, scale and complexity of the risks that the undertaking faces.
- The standard calculation of the expense risk sub-module is an undue burden for the undertaking.

SCR.7.64. The simplification capital requirement for expense risk calculated with the simplified calculation should be equal to the following:

$$Life_{exp} = \left(\frac{n}{10} + \frac{(1+i+0.01)^n - 1}{i+0.01} - \frac{(1+i)^n - 1}{i} \right) \cdot EI$$

where:

(a) EI denotes the amount of expenses incurred in servicing life insurance or reinsurance obligations other than health insurance and reinsurance obligations during the last year;

(b) n denotes the modified duration in years of the cash-flows included in the best estimate of those obligations;

(c) i denotes the weighted average inflation rate included in the calculation of the best estimate of those obligations, weighted by the present value of expenses included in the calculation of the best estimate for servicing existing life obligations.

SCR.7.7.Life_{rev} revision risk

Description

SCR.7.65. Revision risk is the risk of loss, or of adverse change in the value of insurance and reinsurance liabilities, resulting from fluctuations in the level, trend, or volatility of revision rates applied to annuities, due to changes in the legal environment or in the state of health of the person insured.

SCR.7.66. This risk module should be applied only to annuities where the benefits payable under the underlying insurance policies could increase as a result of changes in the legal environment or in the state of health of the person insured.

SCR.7.67. This includes annuities arising from non-life claims (excluding annuities arising from health obligations which are treated in the health SLT module) where the amount of the annuity may be revised during the next year for the reasons mentioned above.

Input

SCR.7.68. No specific input data is required for this module.

Output

SCR.7.69. The module delivers the following output:

$Life_{rev}$ = Capital requirement for revision risk

Calculation

SCR.7.70. The capital requirement for revision risk is determined as follows:

$$Life_{rev} = \Delta BOF | revshock$$

where:

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

$revshock$ = An instantaneous permanent increase of 5% in the annual amount payable for annuities exposed to revision risk. The impact should be assessed considering the remaining run-off period of the annuities.

SCR.7.8.Life_{CAT} catastrophe risk sub-module

Description

SCR.7.71. The life catastrophe sub-module is restricted to (re)insurance obligations which are contingent on mortality, i.e. where an increase in mortality leads to an increase in technical provisions and is defined taking into account the following:

1. multiple insurance policies in respect of the same insured person may be treated as if they were one insurance policy;
2. where the calculation of technical provisions is based on groups of policies as referred to in TP.2.54, the identification of the policies for which technical provisions increase under an increase of mortality rates may also be based on those groups of policies instead of single policies, provided that it would give approximately the same result;

With regard to reinsurance policies, the identification of the policies for which technical provisions increase under an increase of mortality rates shall apply to the underlying insurance policies only and shall be carried out in accordance with SCR.7.72.

SCR.7.72. Catastrophe risk stems from extreme or irregular events whose effects are not sufficiently captured in the other life underwriting risk sub-modules. Examples could be a pandemic event or a nuclear explosion.

SCR.7.73. Catastrophe risk is mainly associated with products (such as term assurance, critical illness or endowment policies) in which a company guarantees to make a single or recurring, periodic series of payments when a policyholder dies.

Input

SCR.7.74. No specific input data is required for this module.

Output

SCR.7.75. The module delivers the following output:

$Life_{CAT}$ = Capital requirement for life catastrophe risk

$nLife_{CAT}$ = Capital requirement for catastrophe risk including the loss-absorbing capacity of technical provisions

Calculation

SCR.7.76. The capital requirement for life catastrophe risk component is defined as follows:

$$Life_{CAT} = \Delta BOF | \text{life CAT shock}$$

where:

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

life CAT shock = Instantaneous increase of 0.15 percentage points to the mortality rates (expressed as percentages) which are used in the calculation of technical provisions to reflect the mortality experience in the following 12 months.

SCR.7.77. The life catastrophe scenario should be calculated under the condition that the scenario does not change the value of future discretionary benefits in technical provisions.

SCR.7.78. Additionally, the result of the scenario should be determined under the condition that the value of future discretionary benefits can change and that undertaking is able to vary its assumptions in future bonus rates in response to the shock being applied. The resulting capital requirement is $nLife_{CAT}$.

Simplification

SCR.7.79. The following simplification may be used provided the following conditions are met:

- The simplification is proportionate to the nature, scale and complexity of the risks that the undertaking faces.
- The standard calculation of the catastrophe risk sub-module is an undue burden for the undertaking.

SCR.7.80. The following formula may be used as a simplification for the Life catastrophe risk sub-module:

$$Life_{CAT} = 0.0015 \cdot \sum_i CAR_i$$

where:

- (a) the sum includes all policies with a positive capital at risk; and
- (b) CAR_i denotes the capital at risk of the policy i , meaning the higher of zero and the difference between the following amounts:
 - (i) the sum of:
 - the amount that the insurance or reinsurance undertaking would currently pay in the event of the death of the persons insured under the contract after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles; and
 - the expected present value of amounts not covered in the previous indent that the undertaking would pay in the future in the event of the immediate death of the

persons insured under the contract after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles;

(ii) the best estimate of the corresponding obligations after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles;

SCR.8. Health underwriting risk

SCR.8.1. Structure of the health underwriting risk module

Description

SCR.8.1. The health underwriting risk module reflects the risk arising from health insurance and reinsurance obligations, in relation to the perils covered and the processes used in the conduct of business.

SCR.8.2. The definition of health insurance and reinsurance obligations is set out in subsection V.2.1 on segmentation. Health (re)insurance obligations can be split according to their technical nature into

- Health insurance obligations pursued on a similar technical basis to that of life insurance (SLT Health); and
- Health insurance obligations not pursued on a similar technical basis to that of life insurance (Non-SLT Health).

SCR.8.3. The health underwriting risk module consists of the following sub-modules:

- the SLT Health underwriting risk sub-module;
- the Non-SLT Health underwriting risk sub-module;
- the health catastrophe risk sub-module.

Input:

SCR.8.4. The following input information is required:

- Health* _{SLT} = Capital requirement for SLT health underwriting risk
- Health* _{NonSLT} = Capital requirement for Non-SLT health underwriting risk
- nHealth* _{SLT} = Capital requirement for SLT health underwriting risk including the loss-absorbing capacity of technical provisions
- Health* _{CAT} = Capital requirement for health catastrophe risk
- nHealth* _{CAT} = Capital requirement for health catastrophe risk including the loss-absorbing capacity of technical provisions risk

Output:

SCR.8.5. The risk module delivers the following output:

- SCR_{Health} = Capital requirement for health underwriting risk
- $nSCR_{Health}$ = Capital requirement for health underwriting risk including the loss-absorbing capacity of technical provisions

Calculation:

SCR.8.6. The capital requirement for health underwriting risk is derived by combining the capital requirements for the health sub-modules using a correlation matrix as follows:

$$SCR_{Health} = \sqrt{\sum_{rxc} CorrHealth_{rxc} \bullet Health_r \bullet Health_c}$$

where:

- $CorrHealth_{rxc}$ = Entries of the matrix $CorrHealth$
- $Health_r, Health_c$ = The capital requirements for individual health underwriting sub-modules according to the rows and columns of correlation matrix $CorrHealth$

and where the correlation matrix $CorrHealth$ is defined as follows:

$CorrHealth$	$Health_{SLT}$	$Health_{NonSLT}$	$Health_{CAT}$
$Health_{SLT}$	1		
$Health_{NonSLT}$	0.5	1	
$Health_{CAT}$	0.25	0.25	1

SCR.8.7. The capital requirement $nSCR_{Health}$ is determined as follows:

$$nSCR_{Health} = \sqrt{\sum_{rxc} CorrHealth_{rxc} \bullet nHealth_r \bullet nHealth_c}$$

SCR.8.2. SLT Health (Similar to Life Techniques) underwriting risk sub-module

Description

SCR.8.8. SLT Health underwriting risk arises from the underwriting of health (re)insurance obligations, pursued on a similar technical basis to life insurance, and is associated with both the perils covered and processes used in the conduct of the business.

SCR.8.9. This sub-module includes annuities arising from Non-SLT health contracts like medical expense, income protection and workers' compensation contracts or health reinsurance contracts related to the previous two types of contracts.

SCR.8.10. The calculations of capital requirements in the SLT health underwriting risk module are based on specified scenarios. General guidance about the interpretation of the scenarios can be found in subsection SCR.1.1.

Input:

SCR.8.11. The following input information is required:

$Health_{mortality}^{SLT}$	=	Capital requirement for SLT Health mortality risk
$Health_{longevity}^{SLT}$	=	Capital requirement for SLT Health longevity risk
$Health_{disability/morbidity}^{SLT}$	=	Capital requirement for SLT Health disability and morbidity risk
$Health_{expense}^{SLT}$	=	Capital requirement for SLT Health expense risk
$Health_{revision}^{SLT}$	=	Capital requirement for SLT Health revision risk
$Health_{lapse}^{SLT}$	=	Capital requirement for SLT Health lapse risk
$nHealth_{mortality}^{SLT}$	=	Capital requirement for SLT Health mortality risk including the loss-absorbing capacity of technical provisions
$nHealth_{longevity}^{SLT}$	=	Capital requirement for SLT Health longevity risk including the loss-absorbing capacity of technical provisions
$nHealth_{disability/morbidity}^{SLT}$	=	Capital requirement for SLT Health disability and morbidity risk including the loss-absorbing capacity of technical provisions
$nHealth_{expense}^{SLT}$	=	Capital requirement for SLT Health expense risk including the loss-absorbing capacity of technical provisions
$nHealth_{revision}^{SLT}$	=	Capital requirement for SLT Health revision risk including the loss-absorbing capacity of technical provisions
$nHealth_{lapse}^{SLT}$	=	Capital requirement for SLT Health lapse risk including the loss-absorbing capacity of technical provisions

Output:

SCR.8.12. The sub-module delivers the following output:

$Health_{SLT}$ = Capital requirement for health (re)insurance obligations pursued on a similar technical basis to that of life insurance

$nHealth_{SLT}$ = Capital requirement for health (re)insurance obligations pursued on a similar technical basis to that of life insurance including the loss-absorbing capacity of technical provisions

Calculation:

SCR.8.13. The capital requirement for SLT Health underwriting risk is derived by combining the capital requirements for the SLT Health sub-modules using a correlation matrix as follows:

$$Health_{SLT} = \sqrt{\sum_{rxc} CorrHealth_{rxc}^{SLT} \bullet Health_r^{SLT} \bullet Health_c^{SLT}}$$

where:

$CorrHealth_{rxc}^{SLT}$ = Entries of the matrix $CorrHealth^{SLT}$

$Health_r^{SLT}$, = The capital requirements for individual health underwriting sub-modules according to the rows and columns of correlation matrix $CorrHealth^{SLT}$

and where the correlation matrix $CorrHealth^{SLT}$ is defined as follows:

	Mortality	Longevity	Disability/ morbidity	Lapse	Expense	Revision
Mortality	1					
Longevity	-0.25	1				
Disability/ morbidity	0.25	0	1			
Lapse	0	0.25	0	1		
Expense	0.25	0.25	0.50	0.5	1	
Revision	0	0.25	0	0	0.50	1

SCR.8.14. The capital requirement $nHealth_{SLT}$ is determined as follows:

$$nHealth_{SLT} = \sqrt{\sum_{rxc} CorrHealth_{rxc}^{SLT} \bullet nHealth_r^{SLT} \bullet nHealth_c^{SLT}}$$

SLT Health mortality risk

Description:

SCR.8.15. The SLT Health mortality risk covers the risk of loss, or of adverse change in the value of (re)insurance liabilities, resulting from changes in the level, trend, or volatility of mortality rates, where an increase in the mortality rate leads to an increase in the value of (re)insurance liabilities without the risk margin taking into account the following:

1. multiple insurance policies in respect of the same insured person may be treated as if they were one insurance policy;
2. where the calculation of technical provisions is based on groups of policies as referred to in TP.2.53, the identification of the policies for which technical provisions increase under an increase of mortality rates may also be based on those groups of policies instead of single policies, provided that it would give approximately the same result.

With regard to reinsurance obligations, the identification of the policies for which technical provisions increase under an increase of mortality rates shall apply to the underlying insurance policies only and shall be carried out in accordance with SCR.8.15.

SCR.8.16. The SLT Health mortality sub-module aims at capturing the increase in general mortality that negatively affects the obligations of the undertaking. For the health products concerned by this risk, mortality risk relates to the general mortality probabilities used in the calculation of the technical provisions. Even if the health product does not insure death risk, there may be a significant mortality risk because the valuation includes profit at inception: if the policyholder dies early he/she will not pay future premiums and the profit of the insurer will be lower than allowed for in the technical provisions. For SLT health (re)insurance this can be a relevant effect.

SCR.8.17. The risk module delivers the following output:

$Health_{mortality}^{SLT}$ = Capital requirement for SLT Health mortality risk

$nHealth_{mortality}^{SLT}$ = Capital requirement for SLT Health mortality risk including the loss-absorbing capacity of technical provisions

SCR.8.18. The calculation of $Health_{mortality}^{SLT}$ and $nHealth_{mortality}^{SLT}$ is made in the same way as in the mortality risk sub-module of the life underwriting risk module, including the proposed simplification.

SLT Health longevity risk

Description:

SCR.8.19. The SLT Health longevity risk covers the risk of loss, or of adverse change in the value of (re)insurance liabilities, resulting from the changes in the level, trend, or volatility of mortality rates, where a decrease in the mortality rate leads to an

increase in the value of (re)insurance liabilities without risk margin taking into account the following:

1. multiple insurance policies in respect of the same insured person may be treated as if they were one insurance policy;
2. where the calculation of technical provisions is based on groups of policies as referred to in TP.2.53, the identification of the policies for which technical provisions increase under an decrease of mortality rates may also be based on those groups of policies instead of single policies, provided that it would give approximately the same result.

With regard to reinsurance obligations, the identification of the policies for which technical provisions increase under an decrease of mortality rates shall apply to the underlying insurance policies only and shall be carried out in accordance with SCR.8.19.

SCR.8.20. The risk module delivers the following output:

$$\begin{aligned} \mathit{Health}_{longevity}^{SLT} &= \text{Capital requirement for SLT Health longevity risk} \\ n\mathit{Health}_{longevity}^{SLT} &= \text{Capital requirement for SLT Health longevity risk including the loss-absorbing capacity of technical provisions} \end{aligned}$$

SCR.8.21. The calculation of $\mathit{Health}_{longevity}^{SLT}$ and $n\mathit{Health}_{longevity}^{SLT}$ is made in the same way as in the longevity risk sub-module of the life underwriting risk module, including the proposed simplification.

SLT Health disability/morbidity risk

Description:

SCR.8.22. The SLT Health disability/morbidity risk covers the risk of loss, or of adverse change in the value of (re)insurance liabilities, resulting from changes in the level, trend or volatility of the frequency or the initial severity of the claims, due to changes:

- In the disability, sickness and morbidity rates
- In medical inflation

SCR.8.23. The disability/morbidity risk sub-module is based on a distinction between medical expense insurance and income protection insurance:

- **Medical expense insurance obligations** are obligations which cover the provision of preventive or curative medical treatment or care including medical treatment or care due to illness, accident, disability and infirmity, or financial compensation for such treatment or care.

- **Income protection insurance obligations** are obligations which cover financial compensation in consequence of illness, accident, disability or infirmity other than obligations considered as medical expenses insurance obligations.

SCR.8.24. These terms are defined in similar way as in Non-SLT health insurance, but with the difference that no separate segment for workers' compensation insurance is established. SLT health insurance obligations which cover workers' compensation need to be assigned according to their nature to either medical expense insurance or income protection insurance.

SCR.8.25. Medical expense reinsurance and income protection reinsurance are defined as reinsurance relating to medical expense insurance and income protection insurance respectively.

SCR.8.26. The following input information are required:

$Health_{medical}^{SLT}$ = Capital requirement for disability/morbidity risk for medical expense (re)insurance

$Health_{income}^{SLT}$ = Capital requirement for disability/morbidity risk for income protection (re)insurance

$nHealth_{medical}^{SLT}$ = Capital requirement for disability/morbidity risk for medical expense (re)insurance including the loss-absorbing capacity of technical provisions

$nHealth_{income}^{SLT}$ = Capital requirement for disability/morbidity risk for income protection (re)insurance including the loss-absorbing capacity of technical provisions

SCR.8.27. The risk module delivers the following output:

$Health_{disability/morbidity}^{SLT}$ = Capital requirement for SLT Health disability and morbidity risk

$nHealth_{disability/morbidity}^{SLT}$ = Capital requirement for SLT Health disability and morbidity risk including the loss-absorbing capacity of technical provisions

SCR.8.28. The capital requirement for SLT Health disability/morbidity risk is determined as follows:

$$Health_{disability/morbidity}^{SLT} = Health_{medical}^{SLT} + Health_{income}^{SLT}$$

$$nHealth_{disability/morbidity}^{SLT} = nHealth_{medical}^{SLT} + nHealth_{income}^{SLT}$$

SLT Health disability/morbidity risk for medical expense (re)insurance

SCR.8.29. For medical expense (re)insurance, the determination of the disability/morbidity capital requirement cannot be based on disability or morbidity probabilities. A large part of the risk in medical expense (re)insurance is

independent from the actual health status of insured person. For example, it may be very expensive to find out whether the insured person is ill or to prevent the insured person from becoming ill – these expenses are usually covered by the health policy. If an insured person is ill, the resulting expenses significantly depend on the individual case. It can also happen that an insured person is ill but does not generate significant medical expenses.

SCR.8.30. Moreover, technically the business is not based on disability /morbidity probabilities but on expected annual medical expenses.

Input

SCR.8.31. The calculation is scenario-based. Input information is the effect of two specified scenarios on the loss in basic own funds of insurance and reinsurance undertakings.

Output

SCR.8.32. The sub-module delivers the following output

$Health_{medical}^{SLT}$ = Capital requirement for disability/morbidity risk for medical expense (re)insurance

$nHealth_{medical}^{SLT}$ = Capital requirement for disability/morbidity risk for medical expense (re)insurance including the loss-absorbing effect of technical provisions

Calculation

SCR.8.33. The capital requirement is computed by analysing the scenarios *shock up* and *shock down* defined as follows:

Scenario	Permanent change of the inflation rate of medical payments	Permanent change in the amount of medical expenses
<i>shock up</i>	+1%	+5%
<i>shock down</i>	-1%	-5%

SCR.8.34. The scenario *shock down* needs only to be analysed for policies that include a premium adjustment mechanism which foresees an increase of premiums if claims are higher than expected and a decrease of premiums if claims are lower than expected. Otherwise, undertakings should assume that the result of the scenario *shock down* is zero.

SCR.8.35. In a first step, capital requirements for increase and decrease of claims are calculated:

$$Health_{medical,up}^{SLT} = \Delta BOF / shock\ up$$

$$Health_{medical,down}^{SLT} = \Delta BOF / shock\ down$$

$$nHealth_{medical,up}^{SLT} = \Delta BOF / \text{shock up}$$

$$nHealth_{medical,down}^{SLT} = \Delta BOF / \text{shock down}$$

SCR.8.36. ΔBOF is the loss in basic own funds of insurance and reinsurance undertakings under the scenario. The scenario is assumed to occur immediately after the valuation date. In the first two scenarios, the calculation is made under the condition that the assumptions on future bonus rates remain unchanged before and after the shocks. The last two calculations are made under the condition that the assumptions on future bonus rates may be changed in response to the shock. Moreover, the revaluation should allow for any relevant adverse changes in policyholders behaviour (option take-up) in this scenario.

SCR.8.37. The relevant scenario (*up* and *down*) is the most adverse scenario taking into account the loss-absorbing capacity of technical provisions:

$$nHealth_{medical}^{SLT} = \max(nHealth_{medical,up}^{SLT}; nHealth_{medical,down}^{SLT})$$

$$Health_{medical}^{SLT} = \begin{cases} Health_{medical,up}^{SLT} & \text{if } nHealth_{medical,up}^{SLT} > nHealth_{medical,down}^{SLT} \\ Health_{medical,down}^{SLT} & \text{if } nHealth_{medical,up}^{SLT} < nHealth_{medical,down}^{SLT} \\ \max(Health_{medical,up}^{SLT}; Health_{medical,down}^{SLT}) & \text{if } nHealth_{medical,up}^{SLT} = nHealth_{medical,down}^{SLT} \end{cases}$$

SLT Health disability/morbidity risk for income protection (re)insurance

For income protection (re)insurance, the determination of the capital requirement for disability/morbidity risk is based on disability or morbidity probabilities. Considering that the risk in income protection (re)insurance depends on the health status of the insured person, the SLT Health disability/morbidity risk for income protection (re)insurance should be treated in a similar manner as disability/morbidity risk in the Life underwriting risk module. However, the instantaneous decrease in morbidity/disability recovery rates as in SCR.7.35. shall be replaced by the following two instantaneous permanent shocks:

- a decrease of 20% in morbidity/disability recovery rates where those recovery rates used in the calculation of technical provisions are lower than 50%.
- A decrease of 20% in morbidity/disability rates where those rates used in the calculation of technical provisions are equal or lower than 50%.

SCR.8.38. The risk module delivers the following output:

$$Health_{income}^{SLT} = \text{Capital requirement for disability/morbidity risk for income protection (re)insurance}$$

$$nHealth_{income}^{SLT} = \text{Capital requirement for disability/morbidity risk for income protection (re)insurance including the loss-absorbing capacity of technical provisions}$$

SCR.8.39. The calculation of $Health_{income}^{SLT}$ and $nHealth_{income}^{SLT}$ is made in the same way as set out for the disability-morbidity risk sub-module of the life underwriting risk module, including the proposed simplification.

SLT Health expense risk

SCR.8.40. The SLT Health expense risk covers the risk of loss, or of adverse change in the value of (re)insurance liabilities, resulting from changes in the level, trend, or volatility of the expenses incurred in servicing insurance or reinsurance contracts. Expense risk arises if the expenses anticipated when pricing a guarantee are insufficient to cover the actual costs accruing in the following year. All expenses incurred have to be taken into account.

SCR.8.41. The risk module delivers the following output:

$$\begin{aligned}
 Health_{expense}^{SLT} &= \text{Capital requirement for SLT Health expense risk} \\
 nHealth_{expense}^{SLT} &= \text{Capital requirement for SLT Health expense risk including the loss-absorbing capacity of technical provisions}
 \end{aligned}$$

SCR.8.42. The calculation of $Health_{expense}^{SLT}$ and $nHealth_{expense}^{SLT}$ is computed as in the life expense risk sub-module of the life underwriting risk module, including the proposed simplifications.

SCR.8.43. Simplification

The same simplification as in the Life expense risk sub-module (SCR.7.65) may be used provided the same conditions are met:

- The simplification is proportionate to the nature, scale and complexity of the risks that the undertaking faces.
- The standard calculation of the catastrophe risk sub-module is an undue burden for the undertaking.

The capital requirement for medical expense disability-morbidity risk calculated with the simplified calculation should be equal to the following:

$$SCR_{medicalexpense} = \left(0.1 \cdot n + \frac{(1+i+0.01)^n - 1}{i+0.01} - \frac{(1+i)^n - 1}{i} \right) \cdot EI$$

where:

- (a) EI denotes the amount of expenses incurred in servicing life insurance or reinsurance obligations other than health insurance and reinsurance obligations during the last year;

(b) n denotes the modified duration in years of the cash-flows included in the best estimate of those obligations;

(c) i denotes the weighted average inflation rate included in the calculation of the best estimate of those obligations, weighted by the present value of expenses included in the calculation of the best estimate for servicing existing life obligations.

SLT Health revision risk

SCR.8.44. The SLT Health revision risk covers the risk of loss, or of adverse change in the value of annuity (re)insurance liabilities resulting from fluctuations in the level, trend, or volatility of the revision rates applied to benefits, due to changes in:

- inflation
- the legal environment (or court decision); only future changes approved or strongly foreseeable at the calculation date under the principle of constant legal environment, or
- the state of health of the person insured (sick to sicker, partially disabled to fully disabled, temporarily disabled to permanently disabled).

SCR.8.45. The SLT Health revision risk sub-module applies in particular to annuities arising from Non-SLT health insurance.

SCR.8.46. The risk module delivers the following output:

$$\begin{aligned} \mathit{Health}_{revision}^{SLT} &= \text{Capital requirement for SLT Health revision risk} \\ &= \text{Capital requirement for SLT Health revision risk} \\ &\quad \text{including the loss-absorbing capacity of technical} \\ &\quad \text{provisions} \end{aligned}$$

SCR.8.47. The calculation of $\mathit{Health}_{revision}^{SLT}$ and $n\mathit{Health}_{revision}^{SLT}$ is made in the same way as in the revision risk sub-module of the life underwriting risk module, but with a stress of 4% instead of 3%.

SLT Health lapse risk

Description:

SCR.8.48. The SLT Health lapse risk covers the risk of loss, or of adverse change in the value of (re)insurance liabilities, resulting from changes in the level or volatility of the rates of policy lapses, terminations, renewals and surrenders.

SCR.8.49. The risk module delivers the following output:

$$\mathit{Health}_{lapse}^{SLT} = \text{Capital requirement for SLT Health lapse risk}$$

$nHealth_{lapse}^{SLT}$ = Capital requirement for SLT Health lapse risk including the loss-absorbing capacity of technical provisions

The calculation of $Health_{lapse}^{SLT}$ and $nHealth_{lapse}^{SLT}$ is computed in the same way as in the lapse risk sub-module of the life underwriting risk module and subject to the same provisions on policyholder options, but with the following change:

$Lapseshock_{mass}$ = The combination of the following instantaneous changes:

- the discontinuance of 40 % of the insurance policies for which discontinuance would result in an increase of technical provisions without the risk margin;
- where reinsurance contract covers insurance or reinsurance contracts that will be written in the future, the decrease of 40 % of the number of those future insurance or reinsurance contracts used in the calculation of the technical provisions.

SCR.8.3.Non-SLT Health (Not Similar to Life Techniques) underwriting risk sub-module

Description

SCR.8.50. Non-SLT Health underwriting risk arises from the underwriting of health (re)insurance obligations, not pursued on a similar technical basis to that of life insurance, following from both the perils covered and processes used in the conduct of business. Non-SLT Health underwriting risk also includes the risk resulting from uncertainty included in assumptions about exercise of policyholder options like renewal or termination options.

SCR.8.51. The Non-SLT Health underwriting risk sub-module takes account of the uncertainty in the results of undertakings related to existing insurance and reinsurance obligations as well as to the new business expected to be written over the following 12 months.

SCR.8.52. The Non-SLT Health underwriting risk sub-module does not include the risk relation to extreme or exceptional events. This risk is captured in the health catastrophe sub-module

Input

SCR.8.53. The following input information is required:

$Health_{pr}^{NonSLT}$ = Capital requirement for Non-SLT Health premium and reserve risk

$Health_{lapse}^{NonSLT}$ = Capital requirement for Non-SLT Health lapse risk

Output

SCR.8.54. The risk module delivers the following output:

$Health_{NonSLT}$	=	Capital requirement for Health (re)insurance obligations not pursued on a similar technical basis to that of life insurance
-------------------	---	---

Calculation

SCR.8.55. The capital requirement for non-life underwriting risk is derived by combining the capital requirements for the non-life sub-risks using a correlation matrix as follows:

$$Health^{NonSLT} = \sqrt{\left(Health_{pr}^{NonSLT}\right)^2 + \left(Health_{lapse}^{NonSLT}\right)^2}$$

Non SLT Health premium & reserve risk

SCR.8.56. This module combines a treatment for the two main sources of underwriting risk, premium risk and reserve risk.

SCR.8.57. Premium risk results from fluctuations in the timing, frequency and severity of insured events. Premium risk relates to policies to be written (including renewals) during the period, and to unexpired risks on existing contracts. Premium risk includes the risk that premium provisions turn out to be insufficient to compensate claims or need to be increased.

SCR.8.58. Premium risk also includes the risk resulting from the volatility of expense payments. Expense risk can be quite material for some lines of business and should therefore be fully reflected in the module calculations. Expense risk is implicitly included as part of the premium risk.

SCR.8.59. Reserve risk results from fluctuations in the timing and amount of claim settlements.

Input

SCR.8.60. In order to carry out the non-life premium and reserve risk calculation, undertakings need to determine the following:

PCO_s = Best estimate for claims outstanding for each segment.
This amount should be less the amounts recoverable from reinsurance and special purpose vehicles

P_s = Estimate of the premiums to be earned by the insurance or

		reinsurance undertaking for each segment during the following 12 months
$P_{(last,s)}$	=	The premiums earned by the insurance or reinsurance undertaking for each segment during the last 12 months
$FP_{(existing,s)}$	=	The expected present value of premiums to be earned by the insurance or reinsurance undertaking for each segment after the following 12 months for existing contracts
$FP_{(future,s)}$	=	The expected present value of premiums to be earned by the insurance and reinsurance undertaking for each segment for contracts where the initial recognition date falls in the following 12 months but excluding the premiums to be earned during the 12 months after the initial recognition date

SCR.8.61. Undertakings may not calculate $P_{(last,s)}$, provided that the following conditions are met:

- the administrative, management or supervisory body of the undertaking has decided that its earned premiums in the segment during the following 12 months will not exceed P_s ;
- the undertaking has established effective control mechanisms to ensure that the limits on earned premiums referred to in point (a) will be met;
- the insurance or reinsurance undertaking has informed its supervisory authority about the decision referred to in point (a) and the reasons for it.

SCR.8.62. Premiums shall be net, after deduction of premiums for reinsurance contracts. However, the following premiums for reinsurance contracts shall not be deducted:

- premiums that cannot be taken into account in the calculation of amounts recoverable from reinsurance contracts and Special Purpose Vehicles
- premiums for reinsurance contracts that do not meet the requirements as risk mitigation technique

SCR.8.63. Best estimate for the provision for claims outstanding of a particular segment shall be deducted of the amounts recoverable from reinsurance contracts and special purpose vehicles, provided that the reinsurance contracts or special purpose vehicles meet the requirements as risk mitigation techniques and the volume measure shall not be a negative amount.

SCR.8.64. The module delivers the following output:

$Health_{pr}^{NonSLT}$ = Capital requirement for Non-SLT Health premium and reserve risk

Calculation

SCR.8.65. The capital requirement for the combined premium risk and reserve risk is determined as follows:

$$Health_{Premium\&Reserve}^{NonSLT} = 3 \cdot \sigma_{NonSLTHealth} \cdot V_{NonSLTHealth}$$

where

$V_{NonSLTHealth}$ = Volume measure (for Non-SLT Health (re)insurance obligations)

$\sigma_{NonSLTHealth}$ = Combined standard deviation (for Non-SLT Health (re)insurance obligations) of the reserve and premium risk standard deviation

SCR.8.66. The volume measure $V_{NonSLTHealth}$ and the standard deviation $\sigma_{NonSLTHealth}$ for the Non-SLT Health (re)insurance obligations are determined in 2 steps as follows:

- in a first step, for each segment standard deviations and volume measures for both premium risk and reserve risk are determined;
- in a second step, the standard deviations and volume measures for the premium risk and the reserve risk are aggregated to derive an overall volume measure $V_{NonSLTHealth}$ and an overall standard deviation $\sigma_{NonSLTHealth}$.

Step 1: Volume measures and standard deviations per segment

SCR.8.67. The premium and reserve risk sub-module is based on similar segmentation into segments used for the calculation of technical provisions. However, an insurance line of business and the corresponding line of business for proportional reinsurance are merged into segments, based on the assumption that the risk profile of both lines of business is similar.

SCR.8.68. For each segment, the volume measures and standard deviations for premium and reserve risk are denoted as follows:

$V_{(prem,s)}$ = The volume measure for premium risk

$V_{(res,s)}$ = The volume measure for reserve risk

$\sigma_{(prem,s)}$ = Standard deviation for premium risk

$\sigma_{(res,s)}$ = Standard deviation for reserve risk

SCR.8.69. The volume measure for premium risk in the segment is determined as follows:

$$V_{(prem,s)} = \max(P_s; P_{(last,s)}) + FP_{(existing,s)} + FP_{(future,s)}$$

If the undertaking has met the following conditions,

- (a) the administrative, management or supervisory body of the insurance or reinsurance undertaking has decided that its earned premiums for each segment during the following 12 months will not exceed P_s ;
- (b) the insurance or reinsurance undertaking has established effective control mechanisms to ensure that the limits on earned premiums referred to in point (a) will be met;
- (c) the insurance or reinsurance undertaking has informed its supervisory authority about the decision referred to in point (a) and the reasons for it.

The undertaking may calculate the volume measure for premium risk for each segment in accordance with the following formula:

$$V_{(prem,s)} = P_s + FP_{(existing,s)} + FP_{(future,s)}$$

SCR.8.70. The standard deviation for premium risk gross of reinsurance for each segment are

Segment	Standard deviation for premium risk (gross of reinsurance)
Medical expense insurance and proportional reinsurance	5%
Income protection insurance and proportional reinsurance	8.5%
Workers' compensation insurance and proportional reinsurance	8%
Non-proportional health reinsurance	17%

SCR.8.71. The standard deviation of a segment shall be equal to the product of the gross standard deviation for each segment set out in the table above and the adjustment factor for non-proportional reinsurance, NP_s , which allows undertakings to take into account the risk-mitigating effect of particular per risk excess of loss reinsurance. Nevertheless, for all segments set out in the table above the adjustment factor for non-proportional reinsurance shall be equal to 1.

SCR.8.72. The volume measure for reserve risk for each segment is determined as follows:

$$V_{(res,s)} = PCO_s$$

SCR.8.73. The standard deviation for reserve risk net of reinsurance for each segment are:

LoB	Standard deviation for reserve risk (net of reinsurance)
Medical expense	5%
Income protection	14%
Workers' compensation	11%
Non-proportional health reinsurance	20%

SCR.8.74. The standard deviation for premium and reserve risk in the individual segment is defined by aggregating the standard deviations for both subrisks using the following formula:

$$\sigma_s = \frac{\sqrt{(\sigma_{(prem,s)} V_{(prem,s)})^2 + \sigma_{(prem,s)} \sigma_{(res,s)} V_{(prem,s)} V_{(res,s)} + (\sigma_{(res,s)} V_{(res,s)})^2}}{V_{(prem,s)} + V_{(res,s)}}$$

Step 2: Overall volume measures and standard deviations

SCR.8.75. The volume measure $V_{NonSLHealth}$ is determined as follows:

$$V_{NonSLHealth} = \sum_s V_s$$

Where

$$V_s = (V_{(prem,s)} + V_{(res,s)}) \cdot (0.75 + 0.25 \cdot DIV_s)$$

Where,

$$DIV_s = \frac{\sum_j (V_{(prem,j,s)} + V_{(res,j,s)})^2}{(V_{(prem,s)} + V_{(res,s)})^2}$$

where the index j denotes the geographical segments as set out in Annex L and $V_{(prem,j,s)}$ and $V_{(res,j,s)}$ denote the volume measures as defined above but taking into account only insurance and reinsurance obligations where the underlying risk is situated in the geographical segment j.

DIV_s should be set to 1 for segment Non-proportional health reinsurance.

SCR.8.76. Undertakings may choose to allocate all of their business in a line of business to the main geographical segment in order to simplify the calculation. Therefore, by default, *DIVs* should be set to 1.

SCR.8.77. The overall standard deviation $\sigma_{NonSLTHealth}$ is determined as follows:

$$\sigma_{NonSLTHealth} = \frac{\sqrt{\sum_{rxc} CorrLob_{NonSLT}^{rxc} \cdot \sigma_r \cdot \sigma_c \cdot V_r \cdot V_c}}{\sum_r V_r}$$

where

- r, c = All indices of the form (LoB)
- $CorrLob_{NonSLT}^{rxc}$ = Entries of the correlation matrix $CorrLob_{NonSLT}$
- σ_r, σ_c = Standard deviation for the individual segment, as defined in step 1
- V_r, V_c = Volume measures for the individual segment, as defined in step 1

SCR.8.78. The correlation matrix $CorrLob_{NonSLT}$ between segment is defined as follows:

$CorrLob_{NonSLT}$	<i>Medical expense</i>	<i>Income protection</i>	<i>Workers' compensation</i>	<i>NP health reinsurance</i>
<i>Medical expense</i>	1			
<i>Income protection</i>	0.5	1		
<i>Workers' compensation</i>	0.5	0.5	1	
<i>NP health reinsurance</i>	0.5	0.5	0.5	1

Output

Non SLT Health Lapse risk

SCR.8.79. The capital requirement for lapse risk should be equal to the loss in basic own funds of undertakings that would result from the combination of two shocks:

SCR.8.80.

$$Health_{lapse}^{NonSLT} = \Delta BOF | (lapseshock_1, lapseshock_2),$$

where

$Health_{lapse}^{NonSLT}$	=	Capital requirement for lapse risk
ΔBOF	=	Change in the value of basic own funds (not including changes in the risk margin of technical provisions)
$lapseshock_1$	=	Discontinuance of 40 % of the insurance policies for which discontinuance would result in an increase of technical provisions without the risk margin.
$lapseshock_2$	=	Decrease of 40 % of the number of future insurance or reinsurance contracts used in the calculation of technical provisions associated to reinsurance contracts cover insurance or reinsurance contracts to be written in the future.

SCR.8.81. $lapseshock_1$ and $lapseshock_2$ shall apply uniformly to all insurance and reinsurance contracts concerned. In relation to reinsurance contracts $lapseshock_1$ shall apply to the underlying insurance contracts.

SCR.8.82. For the purpose of determining the loss in basic own funds of the insurance or reinsurance undertaking under $lapseshock_1$, the undertaking shall base the stress on the type of discontinuance which most negatively affects the basic own funds of the undertaking on a per policy basis.

SCR.8.4. Health risk equalization systems

SCR.8.83. In some health insurance markets undertakings participate in risk equalisation systems which mitigate the premium and reserve risk of Non-SLT health insurance. Under particular conditions the risk-mitigating effect of risk equalisation systems can be taken into account in the Quantitative Assessment standard formula. In this case the standard deviations for premium and reserve risk can be fully or partially be replaced by standard deviation which are specific for the risk equalisation system.

SCR.8.84. Health risk equalisation system (HRES) means arrangements under national legislation to share claims payments of non-life health insurance obligations among insurance undertakings and which comply with the following requirements:

- (a) The mechanism for the sharing of claims is transparent and fully specified in advance of the annual period that it applies to;
- (b) The mechanism for the sharing of claims, the number of insurance undertakings that participate in the HRES and the risk characteristics of the business subject to the HRES ensure that for each undertaking participating in the HRES the volatility of annual losses of the business subject to the HRES is significantly reduced by means of the HRES;
- (c) The health insurance subject to the HRES is compulsory and serves as a partial or complete alternative to health cover provided by the statutory social security system;
- (d) In case of default of insurance undertakings participating in the HRES, one or several governments guarantee to fully meet the policyholder claims of the insurance business that is subject to the HRES.

SCR.8.85. EIOPA may for the purposes of the Quantitative Assessment determine standard deviations for non-life health premium and reserve risk for the lines of business medical expense insurance, income protection insurance and workers' compensation insurance for business that is subject to a HRES provided that the following conditions are met:

- (a) the standard deviations are determined separately for each of the lines of business which are subject to the HRES;
- (b) the standard deviation for premium risk is an estimate of the representative standard deviation of an insurance undertaking's combined ratio, being the ratio of the following annual amounts:
 - the sum of the amounts of payments, including the relating expenses, and technical provisions set up for claims incurred during the year for the business subject to the HRES, including any amendments due to the HRES;
 - the earned premium of the year for the business subject to the HRES;
- (c) the standard deviation for reserve risk is an estimate of the representative standard deviation of an insurance undertaking's run-off ratio, being the ratio of the following annual amounts:
 - the run-off result for the business subject to the HRES, including any amendments due to the HRES; the run-off result is the difference between

the best estimate provision for claims outstanding (including incurred but not reported claims) at the beginning of the year and the best estimate provision for claims outstanding for the same claims at the end of the year;

- best estimate provision for claims outstanding (including incurred but not reported claims) at the beginning of the year for the business subject to the HRES;
- (d) the determination of the standard deviation is based on adequate, applicable and relevant actuarial and statistical techniques;
- (e) the determination of the standard deviation is based on complete, accurate and appropriate data that is directly relevant for the business subject to the HRES and reflects the diversification at the level of the insurance undertaking;
- (f) the determination of the standard deviation is based on current and credible information and realistic assumptions;
- (g) the determination of the standard deviation also takes into account any risks which are not mitigated by the HRES, in particular expense risk and risks which are not reflected in the health catastrophe risk sub-module and that could affect a larger number of insurance undertakings subject to the HRES at the same time;
- (h) notwithstanding points (a) to (g), the standard deviation of a segment is not lower than one third of the standard deviation specified in subsection SCR.8.3.

SCR.8.86. Where EIOPA has determined a standard deviation for non-life health insurance premium risk for business subject to a HRES in accordance with the criteria set out above, undertakings should use this standard deviation instead of the standard deviation of the segment specified in subsection SCR.8.3 for the calculation of Non-SLT health premium and reserve risk sub-module.

SCR.8.87. Where not all their business in a line of business *lob* is subject to the HRES, but only a part of it, undertakings should use a premium risk standard deviation for the calculation of Non-SLT health premium and reserve risk sub-module that is equal to the following:

$$\frac{\sigma_{(prem,lob)} \cdot V_{(prem,lob,nHRES)} + \sigma_{(prem,lob,HRES)} \cdot V_{(prem,lob,HRES)}}{V_{(prem,lob,nHRES)} + V_{(prem,lob,HRES)}}$$

where $V_{(prem,lob,nHRES)}$ denotes the volume measure for Non-SLT health premium risk of business in line of business *lob* that is not subject to the HRES, $V_{(prem,lob,HRES)}$ denotes the volume measure for Non-SLT health premium risk of business in line of business *lob* that is subject to the HRES, $\sigma_{(prem,lob)}$ denotes the standard deviation for Non-SLT health premium risk as specified in subsection SCR.8.3 and $\sigma_{(prem,lob,HRES)}$ denotes the standard deviation for non-life health insurance premium risk of line of business *lob* for business subject to the HRES. $V_{(prem,lob,nHRES)}$ and $V_{(prem,lob,HRES)}$ should be calculated in the same way as the volume measure for Non-SLT health premium risk of segment *lob*, but taking into account only the insurance and reinsurance obligations not subject and subject to the HRES respectively. With regard to the standard deviation for reserve risk the same approach should be followed.

SCR.8.5. Health catastrophe risk sub-module

Description

SCR.8.88. The health catastrophe risk capital requirement covers the risk of loss, or of adverse change in the value of insurance liabilities, resulting from the significant uncertainty of pricing and provisioning assumptions related to outbreaks of major epidemics, as well as the unusual accumulation of risks under such extreme circumstances.

SCR.8.89. This module is based on the guidance and advice of the EIOPA Catastrophe Task force. A description of their work has been published on the EIOPA website under “Final guidance on the calibration and application of catastrophe standardised scenarios for the standard formula SCR”.

SCR.8.90. The health catastrophe risk sub-module under the standard formula should be calculated using standardised scenarios.

SCR.8.91. The standardised scenarios for health catastrophes considered in the Quantitative Assessment are:

- Mass accident
- Concentration scenario
- Pandemic scenario

SCR.8.92. It should be noted that:

- Accident concentration and Pandemic scenarios are applicable to worldwide exposures, and the Mass Accident scenario is applicable to exposures in countries listed in Annex M.
- Geographical boundaries are recognised where necessary.
- Scenarios should be provided gross of reinsurance and gross of all other mitigation instruments (for example national pool arrangements). Undertakings should take into account reinsurance and other mitigation instruments to estimate their net loss as specified below.
- Scenarios have not been provided by line of business nor segmented between Non-SLT and SLT. The scenarios are for health in general allowing for the respective risks affecting SLT and Non-SLT.
- The scenarios also apply to proportional reinsurance.

SCR.8.93. The above selection was based on the likelihood of such events occurring being extreme or exceptional and therefore giving rise to losses, or adverse changes in the value of insurance and reinsurance liabilities.

SCR.8.94. The health catastrophe risk sub-module does currently not capture the health catastrophe risk of all exposures. Circumstances in which the standardised scenarios may not be appropriate are:

- Where an undertaking accepts non-proportional reinsurance of some or all of the products included in the health catastrophe scenarios.
- Where undertakings have exposures which are not captured by the health catastrophe scenarios.

The following input information is required:

SCR_{ma}	=	Capital requirement of the mass accident risk sub-module
SCR_{ac}	=	Capital requirement of the accident concentration risk sub-module
SCR_p	=	Capital requirement of the pandemic risk sub-module

SCR.8.95. Undertakings shall apply:

- the mass accident risk sub-module to health insurance and reinsurance obligations other than workers' compensation insurance and reinsurance obligations;
- the accident concentration risk sub-module to workers' compensation insurance and reinsurance obligations and to group income protection insurance and reinsurance obligations;
- the pandemic risk sub-module to health insurance and reinsurance obligations other than workers' compensation insurance and reinsurance obligations.

Output

SCR.8.96. The risk module delivers the following output:

$SCR_{healthCAT}$	=	Capital requirement for Health catastrophe risk sub-module
-------------------	---	--

Calculation

SCR.8.97. The result will be the square root of the sum of the capital requirements for the three scenarios above. It is assumed all three are independent:

$$SCR_{healthCAT} = \sqrt{SCR_{ma}^2 + SCR_{ac}^2 + SCR_p^2}$$

Health Mass Accident risk

SCR.8.98. Health Mass Accident risk aims to capture the risk of having lots of people in one place at one time and a catastrophic event affecting such location and people.

SCR.8.99. The following input information is required:

$E_{(e,s)}$ = Total value of benefits payable by insurance and reinsurance undertakings for event type e in country s .

SCR.8.100. The risk module delivers the following output:

Output

SCR.8.101. The risk module delivers the following output:

SCR_{ma}	=	Capital requirement for the mass accident risk sub-module
------------	---	---

Calculation

SCR.8.102. The capital requirement for the mass accident risk sub-module shall be equal to the following:

$$SCR_{ma} = \sqrt{\sum_s SCR_{(ma,s)}^2}$$

Where the sum includes all countries set out in Annex M and $SCR_{(ma,s)}$ denotes the capital requirement for mass accident risk of country s .

SCR.8.103. For all countries set out in Annex M, the capital requirement for mass accident risk of a particular country s shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles is calculated as follows:

$$L_{(ma,s)} = r_s \cdot \sum_e x_e \cdot E_{(e,s)}$$

where

r_s = Ratio of persons affected by the mass accident in country s ;

x_e = Ratio of persons which will be affected by event type e as the result of the accident

and the sum includes the event types e defined as followed and x_e is given by the percentages set out in the table below:

Event type e	x_e
Death caused by an accident	10 %
Permanent disability caused by an accident	1.5 %
Disability that lasts 10 years caused by an accident	5 %
Disability that lasts 12 months caused by an accident	13.5 %
Medical treatment caused by an accident	30 %

The list of countries referred as s and the corresponding r_s are given in Annex M.

SCR.8.104. For all event types e and all countries set out in Annex M, the sum insured of an insurance or reinsurance undertaking for a particular event type e in a particular country s shall be equal to the following:

$$E_{(e,s)} = \sum_i SI_{(e,i)}$$

where the sum includes all insured persons i of the undertaking who are insured against event type e and are inhabitants of country s and $SI_{(e,i)}$ denotes the value of the benefits payable by the undertaking for the insured person i in case of event type e .

SCR.8.105. The value of the benefits shall be the sum insured or where the insurance contract provides for recurring benefit payments the best estimate of the benefit payments in case of event type e . Where the benefits of an insurance contract depend on the nature or extent of any injury resulting from event e , the calculation of the value of the benefits shall be based on the maximum benefits obtainable under the contract which are consistent with the event. For medical expense insurance and reinsurance obligations the value of the benefits shall be based on an estimate of the average amounts paid in case of event e , assuming the insured person is disabled for the duration specified and taking into account the specific guarantees the obligations include.

Accident concentration risk

SCR.8.106. Accident concentration risk aims to capture the risk of having concentrated exposures, the largest of which is being affected by a disaster. For example: a disaster within densely populated office blocks in a financial hub.

SCR.8.107. The following input information is required:

- C_c = The largest accident risk concentration of insurance and reinsurance undertakings in country c ;
- x_e = Ratio of persons which will receive benefits of event type e as a result of the accident;
- N_e = Number of insured persons of the insurance or reinsurance

undertaking which are insured against event type e and which belong to the largest accident risk concentration of the insurance or reinsurance undertaking in country c ;

$SI_{(e,i)}$ = Value of the benefits payable by the insurance or reinsurance undertaking for the insured person i in case of event type e .

Output

SCR.8.108. The risk module delivers the following output:

SCR_{ac}	=	Capital requirement for the accident concentration risk sub-module
------------	---	--

Calculation

SCR.8.109. The capital requirement for the accident concentration risk sub-module shall be equal to the following:

$$SCR_{ac} = \sqrt{\sum_c SCR_{(ac,c)}^2}$$

Where the sum includes all countries c .

SCR.8.110. For all countries the capital requirement for accident concentration risk of country c shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is calculated as follows:

$$L_{(ac,c)} = C_c \cdot \sum_e x_e \cdot CE_{(e,c)}$$

where the sum includes the event types e set out in SCR.8.104;

SCR.8.111. For all countries, the largest accident risk concentration of an insurance or reinsurance undertaking in a country c shall be equal to the largest number of persons for which the following conditions are met:

- (a) the insurance or reinsurance undertaking has a workers' compensation insurance or reinsurance obligation or an group income protection insurance or reinsurance obligation in relation to each of the persons;
- (b) the obligations in relation to each of the persons cover at least one of the events set out in SCR.8.104;
- (c) the persons are working in the same building which is situated in country c .

SCR.8.112. For all event types and countries, the average sum insured of an insurance or reinsurance undertakings for event type e for the largest accident risk concentration in country c , $CE_{(e,c)}$, shall be equal to the following:

$$CE_{(e,c)} = \frac{1}{N_e} \sum_{i=1}^{N_e} SI_{(e,i)}$$

where the sum includes all the insured persons of the insurance or reinsurance undertaking which are insured against event type e and which belong to the largest accident risk concentration of the insurance or reinsurance undertaking in country c .

SCR.8.113. The value of the benefits shall be the sum insured or where the insurance contract provides for recurring benefit payments the best estimate of the benefit payments in case of event type e . Where the benefits of an insurance contract depend on the nature or extent of any injury resulting from event e , the calculation of the value of the benefits shall be based on the maximum benefits obtainable under the contract which are consistent with the event. For medical expense insurance and reinsurance obligations the value of the benefits shall be based on an estimate of the average amounts paid in case of event e , assuming the insured person is disabled for the duration specified and taking into account the specific guarantees the obligations include.

Pandemic risk

SCR.8.114. Pandemic risk aims to capture the risk that there could be a pandemic that results in non lethal claims, e.g. where victims infected are unlikely to recover and could lead to a large disability claim

SCR.8.115. It will impact the following products:

- disability income (both long and short term).
- products covering permanent and total disability either as a stand alone benefit or as part of another product, such as a stand alone critical illness product.
- Medical expenses insurance

SCR.8.116. The following input information is required:

E = Income protection pandemic exposure of insurance and reinsurance undertakings;

N_c = Number of insured persons of insurance and reinsurance undertakings which are inhabitants of country c and are covered by medical expense insurance or reinsurance obligations, other than workers' compensation insurance or reinsurance obligations, that cover medical expenses resulting from an infectious disease;

$CH_{(h,c)}$ = Best estimate of the amounts payable by insurance and reinsurance undertakings for an insured person in country c in relation to medical expense insurance or reinsurance obligations, other than workers' compensation insurance or reinsurance obligations, for healthcare utilisation h in the event of a pandemic.

Output

SCR.8.117. The risk module delivers the following output:

SCR_p	=	Capital requirement for the pandemic risk sub-module
---------	---	--

Calculation

SCR.8.118. The capital requirement for the pandemic risk sub-module shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is calculated as follows:

$$L_p = 0.000075 \cdot E + 0.4 \cdot \sum_c N_c \cdot M_c$$

where the sum includes all countries c .

SCR.8.119. The income protection pandemic exposure of an insurance or reinsurance undertaking shall be equal to the following:

$$E = \sum_i E_i$$

where the sum includes all insured persons i covered by the income protection insurance or reinsurance obligations other than workers' compensation insurance or reinsurance obligations and E_i denotes the value of the benefits payable by the insurance or reinsurance undertaking, for the insured person i in case of a permanent work disability caused by an infectious disease. The value of the benefits shall be the sum insured or where the contract provides for recurring benefit payments the best estimate of the benefit payments assuming that the insured person is permanently disabled and will not recover.

SCR.8.120. For all countries, the expected average amount payable by insurance or reinsurance undertakings per insured person of a particular country c in case of a pandemic shall be equal to the following:

$$M_c = \sum_h H_h \cdot CH_{(h,c)}$$

where

H_h = Ratio of persons with clinical symptoms which will utilise healthcare of type h

and the sum includes the types of healthcare utilisation h set out as follows.

Healthcare utilisation type h	H_h
Hospitalisation	1 %
Consultation with a medical practitioner	20 %
No formal medical care sought	79%

DRAFT

SCR.9. Non-life underwriting risk

SCR.9.1. SCR_{nl} non-life underwriting risk module

Description

SCR.9.1. Non-life underwriting risk is the risk arising from non-life insurance obligations, in relation to the perils covered and the processes used in the conduct of business.

SCR.9.2. Non-life underwriting risk also includes the risk resulting from uncertainty included in assumptions about exercise of policyholder options like renewal or termination options.

SCR.9.3. The non-life underwriting risk module takes account of the uncertainty in the results of undertakings related to existing insurance and reinsurance obligations as well as to the new business expected to be written over the following 12 months.

SCR.9.4. The non-life underwriting risk module consists of the following sub-modules:

- the non-life premium and reserve risk sub-module
- the non-life lapse risk sub-module
- the non-life catastrophe risk sub-module

Input

SCR.9.5. The following input information is required:

NL_{pr} = Capital requirement for non-life premium and reserve risk

NL_{lapse} = Capital requirement for non-life lapse risk

NL_{CAT} = Capital requirement for non-life catastrophe risk

Output

SCR.9.6. The module delivers the following output:

SCR_{nl} = Capital requirement for non-life underwriting risk

Calculation

SCR.9.7. The capital requirement for non-life underwriting risk is derived by combining the capital requirements for the non-life sub-risks using a correlation matrix as follows:

$$SCR_{nl} = \sqrt{\sum CorrNL_{r,c} \cdot NL_r \cdot NL_c}$$

where

$CorrNL_{r,c}$ = The entries of the correlation matrix $CorrNL$

NL_r, NL_c = Capital requirements for individual non-life underwriting sub-risks according to the rows and columns of correlation

matrix $CorrNL$

and where the correlation matrix $CorrNL$ is defined as:

$CorrNL$	NL_{pr}	NL_{lapse}	NL_{CAT}
NL_{pr}	1		
NL_{lapse}	0	1	
NL_{CAT}	0.25	0	1

SCR.9.2. NL_{pr} Non-life premium & reserve risk

Description

SCR.9.8. This module combines a treatment for the two main sources of underwriting risk, premium risk and reserve risk.

Input

SCR.9.9. In order to carry out the non-life premium and reserve risk calculation, undertakings need to determine the following:

- PCO_s = Best estimate for claims outstanding for each segment. This amount should be less the amount recoverable from reinsurance contracts and special purpose vehicles.
- P_s = Estimate of the premiums to be earned by the insurance or reinsurance undertaking for each segment during the following 12 months
- $P_{(last,s)}$ = The premiums earned by the insurance or reinsurance undertaking for each segment during the last 12 months
- $FP_{(existing,s)}$ = The expected present value of premiums to be earned by the insurance or reinsurance undertaking for each segment after the following 12 months for existing contracts
- $FP_{(future,s)}$ = The expected present value of premiums to be earned by the insurance and reinsurance undertaking for each segment for contracts where the initial recognition date falls in the following 12 months but excluding the premiums to be earned during the 12 months after the initial recognition date

Undertakings may choose not to calculate $P_{(last,s)}$, provided that the following conditions are met:

- (a) the administrative, management or supervisory body of the undertaking has decided that its earned premiums in the segment during the following 12 months will not exceed P_s ;
- (b) the undertaking has established effective control mechanisms to ensure that the limits on earned premiums referred to in point (a) will be met;
- (c) the insurance or reinsurance undertaking has informed its supervisory authority about the decision referred to in point (a) and the reasons for it.

Premiums shall be net, after deduction of premiums for reinsurance contracts. However, the following premiums for reinsurance contracts shall not be deducted:

- a) premiums that cannot be taken into account in the calculation of amounts recoverable from reinsurance contracts and Special Purpose Vehicles
- b) premiums for reinsurance contracts that do not meet the requirements as risk mitigation techniques

Best estimate for the provision for claims outstanding of a particular segment shall be deducted of the amounts recoverable from reinsurance contracts and Special Purpose Vehicles, provided that the reinsurance contracts or special purpose vehicles meet the requirements as risk mitigation techniques in SCR.12. and the volume measure shall not be a negative amount.

SCR.9.10.

Calculation

SCR.9.11. The premium and reserve risk capital requirement delivers the following output information:

$$NL_{pr} = \text{Capital requirement for premium and reserve risk}$$

SCR.9.12. The capital requirement for the combined premium risk and reserve risk is determined as follows:

$$NL_{pr} = 3 \cdot \sigma \cdot V$$

where

V	=	Volume measure
σ	=	Combined standard deviation for non-life premium and reserve risk

SCR.9.13. The volume measure V and the combined standard deviation σ for the overall non-life insurance portfolio are determined in two steps as follows:

- For each individual segmentLoB, the standard deviations and volume measures for both premium risk and reserve risk are determined;

- The standard deviations and volume measures for the premium risk and the reserve risk in the individual segments LoBs are aggregated to derive an overall volume measure V and a combined standard deviation σ .

The calculations needed to perform these two steps are set out below.

Step 1: Volume measures and standard deviations per segment

SCR.9.14. The premium and reserve risk sub-module is based on the same segmentation into lines of business used for the calculation of technical provisions. However, an insurance line of business and the corresponding line of business for proportional reinsurance are merged, based on the assumption that the risk profile of both lines of business is similar. The lines of business for NSLT health insurance and reinsurance are covered in the health underwriting risk module.

SCR.9.15. The following numbering of segments LoBs applies for the calculation:

	Segment
1	Motor vehicle liability insurance and proportional reinsurance
2	Other motor insurance and proportional reinsurance
3	Marine, aviation and transport insurance and proportional reinsurance
4	Fire and other damage to property insurance and proportional reinsurance
5	General liability insurance and proportional reinsurance
6	Credit and suretyship insurance and proportional reinsurance
7	Legal expenses insurance and proportional reinsurance
8	Assistance and its proportional reinsurance
9	Miscellaneous financial loss insurance and proportional reinsurance
10	Non-proportional casualty reinsurance
11	Non-proportional marine, aviation and transport reinsurance
12	Non-proportional property reinsurance

SCR.9.16. For each segment LoB, the volume measures and standard deviations for premium and reserve risk are denoted as follows:

$$V_{(prem,s)} = \text{The volume measure for premium risk}$$

$V_{(res,s)}$	=	The volume measure for reserve risk
$\sigma_{(prem,s)}$	=	standard deviation for premium risk
$\sigma_{(res,s)}$	=	standard deviation for reserve risk

SCR.9.17. The volume measure for premium risk in the individual segment is determined as follows:

$$V_{(prem,s)} = \max(P_s; P_{(last,s)}) + FP_{(existing,s)} + FP_{(future,s)}$$

SCR.9.18. If the undertaking has met the following conditions,

- the administrative, management or supervisory body of the insurance or reinsurance undertaking has decided that its earned premiums for each LoB during the following 12 months will not exceed P_{lob} ;
- the insurance or reinsurance undertaking has established effective control mechanisms to ensure that the limits on earned premiums referred to in point (a) will be met;
- the insurance or reinsurance undertaking has informed its supervisory authority about the decision referred to in point (a) and the reasons for it.

The undertaking may calculate the volume measure for premium risk for each segment LoB in accordance with the following formula:

$$V_{(prem,s)} = P_s + FP_{(existing,s)} + FP_{(future,s)}$$

SCR.9.19. The standard deviation for premium risk gross of reinsurance for each segment are:

Segment	Standard deviation for premium risk (gross of reinsurance)
<i>1. Motor vehicle liability insurance and proportional reinsurance</i>	$10\% \cdot NP_{lob}$
<i>2. Other motor insurance and proportional reinsurance</i>	$8\% \cdot NP_{lob}$
<i>3. MAT insurance and proportional reinsurance</i>	$15\% \cdot NP_{lob}$
<i>4. Fire insurance and proportional reinsurance</i>	$8\% \cdot NP_{lob}$
<i>5. 3rd-party liability insurance and proportional reinsurance</i>	$14\% \cdot NP_{lob}$

6. Credit insurance and proportional reinsurance	12% · NP _{lob}
7. Legal expenses insurance and proportional reinsurance	7% · NP _{lob}
8. Assistance insurance and proportional reinsurance	9% · NP _{lob}
9. Miscellaneous insurance and proportional reinsurance	13% · NP _{lob}
10. Np reins (cas)	17%
11. Np reins (MAT)	17%
12. Np reins (prop)	17%

SCR.9.20. The standard deviation of a segment shall be equal to the product of the gross standard deviation for each segment set out in the table above and the adjustment factor for non-proportional reinsurance, NP_{lob}, which allows undertakings to take into account the risk-mitigating effect of particular per risk excess of loss reinsurance. Nevertheless, for all segments 10-12 set out in the table above the adjustment factor for non-proportional reinsurance shall be equal to 1.

SCR.9.21. For segments 1, 4 and 5 set out in the SCR.9.19 the adjustment factor for non-proportional reinsurance shall be equal to 80 %. For all other (non-life) segments set out in the table above the adjustment factor for non-proportional reinsurance shall be equal to 100 %.

SCR.9.22. The volume measure for reserve risk for each individual segment is determined as follows:

$$V_{(res,s)} = PCO_s$$

SCR.9.23. The standard deviation for reserve risk net of reinsurance for each segment are:

LoB _t	standard deviation for reserve risk (net of reinsurance)
Motor vehicle liability insurance and proportional reinsurance	9%
Other motor insurance and proportional reinsurance	8%
MAT insurance and proportional reinsurance	11%
Fire insurance and proportional reinsurance	10%
3rd-party liability insurance and proportional reinsurance	11%

<i>Creditinsurance and proportional reinsurance</i>	19%
<i>Legal expensesinsurance and proportional reinsurance</i>	12%
<i>Assistanceinsurance and proportional reinsurance</i>	20%
<i>Miscellaneousinsurance and proportional reinsurance</i>	20%
<i>Np reins (cas)</i>	20%
<i>Np reins (MAT)</i>	20%
<i>Np reins (prop)</i>	20%

SCR.9.24. No further adjustments are needed to these results.

SCR.9.25. The standard deviation for premium and reserve risk in the individual segment is defined by aggregating the standard deviations for both subrisks using the following formula

$$\text{SCR.9.26. } \sigma_s = \frac{\sqrt{(\sigma_{(prem,s)} V_{(prem,s)})^2 + \sigma_{(prem,s)} \sigma_{(res,s)} V_{(prem,s)} V_{(res,s)} + (\sigma_{(res,s)} V_{(res,s)})^2}}{V_{(prem,s)} + V_{(res,s)}}$$

Step 2: Overall volume measures and standard deviations

SCR.9.27. The overall standard deviation σ is determined as follows:

$$\sigma_{nl} = \frac{1}{V_{nl}} \cdot \sqrt{\sum_{s,t} \text{Corr}S_{(s,t)} \cdot \sigma_s \cdot V_s \cdot \sigma_t \cdot V_t}$$

where

s, t = All indices of the form (segment)

$\text{Corr}S_{s,t}$ = The entries of the correlation matrix $\text{Corr}S$

V_s, V_t = Volume measures for premium and reserve risk of segments s and t respectively

σ_s, σ_t = standard deviations for non-life premium and reserve risk of segments s and t respectively

SCR.9.28. The overall volume measure for each segment, V_s is obtained as follows:

SCR.9.29.

$$V_s = (V_{(prem,s)} + V_{(res,s)}) \cdot (0.75 + 0.25 \cdot DIV_s)$$

where

$$DIV_s = \frac{\sum_j (V_{(prem,j,s)} + V_{(res,j,s)})^2}{(V_{(prem,s)} + V_{(res,s)})^2}$$

where the index j denotes the geographical segments as set out in Annex L and $V_{(prem,j,s)}$ and $V_{(res,j,s)}$ denote the volume measures as defined above but taking into account only insurance and reinsurance obligations where the underlying risk is situated in the geographical segment j .

SCR.9.30. Furthermore, DIV_s should be set to 1 for segments 6, 10, 11 and 12 set out in SCR 9.18.

Undertakings may choose to allocate all of their business in a segment to the main geographical segment in order to simplify the calculation. Therefore, by default, DIV_s should be set to 1.

SCR.9.31. The correlation matrix $CorrS$ is defined as follows:

<i>CorrS</i>	1	2	3	4	5	6	7	8	9	10	11	12
1: Motor vehicle liability	1											
2: Other motor	0,5	1										
3: MAT	0,5	0,25	1									
4: Fire	0,25	0,25	0,25	1								
5: 3rd party liability	0,5	0,25	0,25	0,25	1							
6: Credit	0,25	0,25	0,25	0,25	0,5	1						
7: Legal exp.	0,5	0,5	0,25	0,25	0,5	0,5	1					
8: Assistance	0,25	0,5	0,5	0,5	0,25	0,25	0,25	1				
9: Miscellaneous.	0,5	0,5	0,5	0,5	0,5	0,5	0,5	0,5	1			
10:Np reins. (casualty)	0,25	0,25	0,25	0,25	0,5	0,5	0,5	0,25	0,25	1		
11:Np reins. (MAT)	0,25	0,25	0,5	0,5	0,25	0,25	0,25	0,25	0,5	0,25	1	
12:Np reins. (property)	0,25	0,25	0,25	0,5	0,25	0,25	0,25	0,5	0,25	0,25	0,25	1

Output

SCR.9.32. This module delivers the following output information:

NL_{pr} = Capital requirement for premium and reserve risk

SCR.9.3. NL_{Lapse} Lapse risk

SCR.9.33. The capital requirement for lapse risk should be equal to the loss in basic own funds of undertakings that would result from the combination of two shocks:

$$Health_{lapse}^{NonSLT} = \Delta BOF | (lapseshock_1, lapseshock_2),$$

where

$Health_{lapse}^{NonSLT}$ = Capital requirement for lapse risk

ΔBOF = Change in the value of basic own funds (not including changes in the risk margin of technical provisions)

$lapseshock_1$ = Discontinuance of 40 % of the insurance policies for which discontinuance would result in an increase of technical provisions without the risk margin.

$lapseshock_2$ = Decrease of 40 % of the number of future insurance or reinsurance contracts used in the calculation of technical provisions associated to reinsurance contracts cover insurance or reinsurance contracts to be written in the future.

SCR.9.34. $lapseshock_1$ and $lapseshock_2$ shall apply uniformly to all insurance and reinsurance contracts concerned. In relation to reinsurance contracts $lapseshock_1$ shall apply to the underlying insurance contracts.

SCR.9.35. For the purpose of determining the loss in basic own funds of the insurance or reinsurance undertaking under $lapseshock_1$, the undertaking shall base the stress on the type of discontinuance which most negatively affects the basic own funds of the undertaking on a per policy basis.

SCR.9.4. Non life CAT risk sub - module

Description

SCR.9.36. Under the non-life underwriting risk module, catastrophe risk is defined in the Solvency II Framework Directive (Directive 2009/138/EC) as: “the risk of loss, or of adverse change in the value of insurance liabilities, resulting from significant

uncertainty of pricing and provisioning assumptions related to extreme or exceptional events.”

SCR.9.37. CAT risks stem from extreme or irregular events that are not sufficiently captured by the capital requirements for premium and reserve risk. The catastrophe risk capital requirement has to be calibrated at the 99.5% VaR (annual view).

SCR.9.38. The CAT risk sub-module shall consist of the following sub-modules:

- (a) the natural catastrophe risk sub-module;
- (b) the sub-module for catastrophe risk of non-proportional property reinsurance;
- (c) the man-made catastrophe risk sub-module;
- (d) the sub-module for other non-life catastrophe risk.

Input

SCR.9.39. The following input information is required:

SCR_{natCAT}	=	Capital requirement for natural catastrophe risk
$SCR_{npproperty}$	=	Capital requirement for the catastrophe risk of non-proportional property reinsurance
SCR_{mmCAT}	=	Capital requirement for man-made catastrophe risk
$SCR_{CATother}$	=	Capital requirement for other non-life catastrophe risk

Output

SCR_{nlCAT}	=	Capital requirement for non-life catastrophe risk
---------------	---	---

Calculation

$$SCR_{nlCAT} = \sqrt{\left(SCR_{natCAT} + SCR_{npproperty}\right)^2 + SCR_{mmCAT}^2 + SCR_{CATother}^2}$$

Natural catastrophe risk

Description

SCR.9.40. The natural catastrophe risk sub-module shall consist of the following sub-modules:

- (a) the windstorm risk sub-module;
- (b) the earthquake risk sub-module;
- (c) the flood risk sub-module;

- (d) the hail risk sub-module;
- (e) the subsidence risk sub-module.

SCR.9.41. The capital requirement for natural catastrophe risk shall be equal to the following:

$$SCR_{natCAT} = \sqrt{\sum_i SCR_i^2}$$

where the sum includes all possible combinations sub-modules set out in paragraph 1 and SCR_i denotes the capital requirement for risk sub-module i .

Windstorm risk

Input

SCR.9.42. The following input information is required:

$SI_{(property,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 7 and 19 as set out in Annex K in relation to contracts that cover windstorm risk and where the risk is situated in windstorm zone i of region r

$SI_{(onshore-property,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 6 and 18 as set out in Annex K in relation to contracts that cover onshore property damage by windstorm and where the risk is situated in windstorm zone i of region r

$WSI_{(windstorm,r,i)}$ = Weighted sums insured for windstorm risk in windstorm zones i of region r

$P_{windstorm}$ = Estimate of the premiums to be earned by insurance and reinsurance undertakings for each contract that covers the obligations referred to in SCR.9.59 during the following 12 months; for this purpose premiums shall be gross, without deduction of premiums for reinsurance contracts

Calculation

SCR.9.43. The capital requirement for windstorm risk shall be equal to the following:

$$SCR_{windstorm} = \sqrt{\left(\sum_{(r,s)} CorrWS_{(r,s)} \cdot SCR_{(windstormr)} \cdot SCR_{(windstorms)} \right) + SCR_{(windstorm\ other)}^2}$$

where:

- (a) the sum includes all possible combinations (r,s) of the regions set out in Annex N;
- (b) $CorrWS_{(r,s)}$ denotes the correlation coefficient for windstorm risk for region r and region s as set out in Annex N;
- (c) $SCR_{(windstorm,r)}$ and $SCR_{(windstorm,s)}$ denote the capital requirements for windstorm risk in region r and s respectively;
- (d) $SCR_{(windstorm,other)}$ denotes the capital requirement for windstorm risk in regions other than those set out in Annex O.

SCR.9.44. For all regions set out in Annex N the capital requirement for windstorm risk in a particular region r shall be the larger of the following two capital requirements the capital requirement for windstorm risk in region r according to scenario A and the capital requirement for windstorm risk in region r according to scenario B:

$$SCR_{(windstorm,r)} = \max(SCR_{(windstorm,A,r)}; SCR_{(windstorm,B,r)})$$

SCR.9.45. For all regions set out in Annex N the capital requirement for windstorm risk in a particular region r according to scenario A shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to a sequence of events:

$$SCR_{(windstorm,A,r)} = \Delta BOF | wind_{(A,r)}$$

where

ΔBOF = Change in the value of basic own funds

$wind_{A,r}$ = Instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 100 % of the specified windstorm loss in region r followed by a loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 20 % of the specified windstorm loss in region r .

SCR.9.46. For all regions set out in Annex N the capital requirement for windstorm risk in a particular region r according to scenario B shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from a sequence of events:

$$SCR_{(windstorm,B,r)} = \Delta BOF | wind_{(B,r)}$$

where

ΔBOF	=	Change in the value of basic own funds
$wind_{B,r}$	=	Instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 80 % of the specified windstorm loss in region r followed by a loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 40 % of the specified windstorm loss in region r .

SCR.9.47. Undertakings shall base the calculation of the capital requirement on the following assumptions:

- (a) the two consecutive events referred in SCR.9.49 and SCR.9.50 are independent;
- (b) undertakings do not enter into new insurance risk mitigation techniques between the two events.

SCR.9.48. Where current reinsurance contracts allow for reinstatements, insurance and reinsurance undertakings shall take into account future management actions in relation to the reinstatements between the first and the second event. The assumptions about future management actions should be realistic, objective and verifiable.

SCR.9.49. For all regions set out in Annex N, the specified windstorm loss in a particular region r shall be equal to the following amount:

$$L_{(windstormr)} = Q_{(windstormr)} \cdot \sqrt{\sum_{(i,j)} Corr_{(windstormr,i,j)} \cdot WSI_{(windstormr,i)} \cdot WSI_{(windstormr,j)}}$$

where:

- (a) $Q_{(windstorm,r)}$ denotes the windstorm risk factor for region r as set out in Annex N;
- (b) the sum includes all possible combinations of windstorm zones (i,j) ;
- (c) $Corr_{(windstorm,r,i,j)}$ denotes the correlation coefficient for windstorm risk in windstorm zones i and j of region r ;
- (d) $WSI_{(windstorm,r,i)}$ and $WSI_{(windstorm,r,j)}$ denote the weighted sums insured for windstorm risk in windstorm zones i and j of region r .

SCR.9.50. For all regions set out in Annex N and all windstorm zones the weighted sum insured for windstorm risk in a particular windstorm zone i of a particular region r shall be equal to the following:

$$WSI_{(windstorm,r,i)} = W_{(windstorm,r,i)} \cdot SI_{(windstorm,r,i)}$$

where:

- (a) $W_{(windstorm,r,i)}$ denotes the risk weight for windstorm risk in windstorm zone i of region r ;
- (b) $SI_{(windstorm,r,i)}$ denotes the sum insured for windstorm risk in windstorm zone i of region r .

SCR.9.51. For all regions set out in Annex N and all windstorm zones, the sum insured for windstorm risk in a particular windstorm zone i of a particular region r shall be equal to the following:

$$SI_{(windstorm,r,i)} = SI_{(property,r,i)} + SI_{(onshore-property,r,i)}$$

SCR.9.52. For all regions set out in Annex N, the windstorm zones of a particular region referred to in point (b) of paragraph 5 shall be made up of geographical divisions of that region which are sufficiently homogeneous in relation to the windstorm risk that the insurance and reinsurance undertakings are exposed to in relation to that region. Together the zones shall comprise the whole region. The zones shall be mutually exclusive of one another. Where the region itself is sufficiently homogeneous in relation to windstorm risk, that region shall be the windstorm zone.

SCR.9.53. For all regions set out in Annex N and all windstorm zones of those regions, the risk weight for windstorm risk $W_{(windstorm,r,i)}$ in a particular windstorm zone i of a particular region r referred to in paragraph 6 shall be specified in such a way that the product of $W_{(windstorm,r,i)}$ and the windstorm risk factor $Q_{(windstorm,r)}$ for region r corresponds to the annual loss caused by windstorm in zone i of region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover windstorm risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.54. For all regions set out in Annex N and all combinations (i,j) of two windstorm zones of one of those regions, the correlation coefficient $Corr_{(windstorm,r,i,j)}$ for windstorm risk in particular windstorm zones i and j of a particular region r shall be selected from one of the following figures: 0, 0.25, 0.5, 0.75 or 1. The correlation coefficient shall be selected in such a way that:

- (a) the correlation coefficient reflects the dependency between windstorm risk in zone i and j , taking into account any non-linearity of the dependence;
- (b) it results in a specified windstorm loss $L_{(windstorm,r)}$ that corresponds to the annual loss caused by windstorm in region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover windstorm risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.55. The capital requirement for windstorm risk in regions other than those set out in Annex O shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss in relation to each insurance and reinsurance contract that covers one or both of the following insurance or reinsurance obligations:

- (a) obligations of lines of business 7 or 19 as set out in Annex K that cover windstorm risk and where the risk is not situated in one of the regions set out in Annex O;
- (b) obligations of lines of business 6 or 18 as set out in Annex K in relation to onshore property damage by windstorm and where the risk is not situated in one of the regions set out in Annex O.

SCR.9.56. The amount of the instantaneous loss, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, referred to in SCR.9.59 shall be equal to the following amount:

$$L_{(windstorm\ other)} = 1.75 \cdot (0.5 \cdot DIV_{windstorm} + 0.5) \cdot P_{windstorm}$$

where $DIV_{windstorm}$ is calculated in accordance with SCR.9.33, but based on the premiums in relation to the obligations referred to in SCR.9.59 and restricted to the regions 5 to 18 set out in Annex L. The splitting of the premium for calculation of $DIV_{windstorm}$ for policies with exposures in multiple geo zones should be based on exposure split.

Earthquake risk

Input

SCR.9.57. The following input information is required:

$SI_{(property,r,i)}$ = Sum insured of the insurance or reinsurance undertaking for lines of business 7 and 19 as set out in Annex K in relation to contracts that cover earthquake risk and where the risk is situated in earthquake zone i of region r

$SI_{(onshore-property,r,i)}$ = Sum insured of the insurance or reinsurance undertaking for lines of business 6 and 18 as set out in Annex K in relation to contracts that cover onshore property damage by earthquake and where the risk is situated in earthquake zone i of region r

$WSI_{(earthquake,r,i)}$ = Weighted sums insured for earthquake risk in earthquake zones i of region r

$P_{earthquake}$ = Estimate of the premiums to be earned by insurance and reinsurance undertakings for each contract that covers the obligations referred to in SCR.9.68 during the following 12 months; for this purpose premiums shall be gross, without deduction of premiums for reinsurance

SCR.9.58. The capital requirement for earthquake risk shall be equal to the following

$$SCR_{earthquake} = \sqrt{\left(\sum_{(r,s)} CorrEQ_{(r,s)} \cdot SCR_{(earthquake,r)} \cdot SCR_{(earthquake,s)} \right)} + SCR_{(earthquake,other)}^2$$

where:

- (a) the sum includes all possible combinations (r,s) of the regions set out in Annex P;
- (b) $CorrEQ_{(r,s)}$ denotes the correlation coefficient for earthquake risk for region r and region s as set out in Annex P;
- (c) $SCR_{(earthquake,r)}$ and $SCR_{(earthquake,s)}$ denote the capital requirements for earthquake risk in region r and s respectively;
- (d) $SCR_{(earthquake,other)}$ denotes the capital requirement for earthquake risk in regions other than those set out in Annex O.

SCR.9.59. For all regions set out in Annex P, the capital requirement for earthquake risk in a particular region r shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to:

$$SCR_{(earthquake,r)} = \Delta BOF | L_{(earthquake,r)},$$

$$L_{(earthquake,r)} = Q_{(earthquake,r)} \cdot \sqrt{\sum_{(i,j)} Corr_{(earthquake,r,i,j)} \cdot WSI_{(earthquake,r,i)} \cdot WSI_{(earthquake,r,j)}}$$

where:

- (a) $Q_{(earthquake,r)}$ denotes the earthquake risk factor for region r as set out in Annex P;
- (b) the sum includes all possible combinations of earthquake zones (i,j) ;
- (c) $Corr_{(earthquake,r,i,j)}$ denotes the correlation coefficient for earthquake risk in earthquake zones i and j of region r ;
- (d) $WSI_{(earthquake,r,i)}$ and $WSI_{(earthquake,r,j)}$ denote the weighted sums insured for earthquake risk in earthquake zones i and j of region r .

SCR.9.60. For all regions set out in Annex P and all earthquake zones, the weighted sum insured for earthquake risk in a particular earthquake zone i of a particular region r shall be equal to the following:

$$WSI_{(earthquake,r,i)} = W_{(earthquake,r,i)} \cdot SI_{(earthquake,r,i)}$$

where:

(a) $W_{(earthquake,r,i)}$ denotes the risk weight for earthquake risk in earthquake zone i of region r ;

(b) $SI_{(earthquake,r,i)}$ denotes the sum insured for earthquake risk in earthquake zone i of region r .

1. For all regions set out in Annex P and all earthquake zones, the sum insured for earthquake risk in a particular earthquake zone i of a particular region r shall be equal to the following:

$$SI_{(earthquake,r,i)} = SI_{(property,r,i)} + SI_{(onshore-property,r,i)}$$

SCR.9.61. For all regions set out in Annex P, the earthquake zones of a particular region referred to in point (b) of paragraph 2 shall be made up of geographical divisions of the region which are sufficiently homogeneous in relation to the earthquake risk that the insurance and reinsurance undertakings are exposed to in relation to the region. Together the zones shall comprise the whole region. The zones shall be mutually exclusive of one another. Where the region itself is sufficiently homogeneous in relation to earthquake risk, that region shall be the earthquake zone.

SCR.9.62. For all regions set out in Annex P and all earthquake zones of those regions, the risk weight for earthquake risk $W_{(earthquake,r,i)}$ in a particular earthquake zone i of a particular region r referred to in paragraph 3 shall be specified in such a way that the product of $W_{(earthquake,r,i)}$ and the earthquake risk factor $Q_{(earthquake,r)}$ for region r corresponds to the annual loss caused by earthquake in zone i of region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover earthquake risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.63. For all regions set out in Annex P and all combinations (i,j) of two earthquake zones of one of those regions, the correlation coefficient $Corr_{(earthquake,r,i,j)}$ for earthquake risk in particular earthquake zones i and j of a particular region r shall be selected from one of the following figures: 0, 0.25, 0.5, 0.75 or 1. The correlation coefficient shall be selected in such a way that:

(a) the correlation coefficient reflects the dependency between earthquake risk in zone i and j , taking into account any non-linearity of the dependence;

(b) it results in a specified earthquake loss $L_{(earthquake,r)}$ that corresponds to the annual loss caused by earthquake in region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover earthquake risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.64. The capital requirement for earthquake risk in regions other than those set out in Annex O shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss in relation to each insurance and reinsurance contract that covers one or both of the following insurance or reinsurance obligations:

- (a) obligations of lines of business 7 or 19 as set out in Annex K that cover earthquake risk, where the risk is not situated in one of the regions set out in Annex O;
- (b) obligations of lines of business 6 or 18 as set out in Annex K in relation to onshore property damage by earthquake, where the risk is not situated in one of the regions set out in Annex O.

SCR.9.65. The amount of the instantaneous loss, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, referred to in SCR.9.68 shall be equal to the following amount:

$$L_{(earthquake\&other)} = 1.2 \cdot (0.5 \cdot DIV_{earthquake} + 0.5) \cdot P_{earthquake}$$

where $DIV_{earthquake}$ is calculated in accordance with SCR.9.33 Annex H, but based on the premiums in relation to the obligations referred to in SCR.9.68 and restricted to the regions 5 to 18 set out in Annex L;

Flood risk

Input

SCR.9.66. The following input information is required:

$SI_{(property,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 7 and 19 as set out in Annex K in relation to contracts that cover flood risk, where the risk is situated in flood zone i of region r

$SI_{(onshore-property,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 6 and 18 as set out in Annex K in relation to contracts that cover onshore property damage by flood and where the risk is situated in flood zone i of region r

$SI_{(motor,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 5 and 17 as set out in Annex K in relation to contracts that cover flood risk, where the risk is situated in flood zone i of region r

$WSI_{(flood,r,i)}$ = Weighted sums insured for flood risk in flood zones i of region r

P_{flood} = Estimate of the premiums to be earned by the insurance or reinsurance undertaking for each contract that covers the obligations referred to in SCR.9.83 during the following 12 months; for this purpose, premiums shall be gross, without deduction of premiums for reinsurance contracts

Calculation

SCR.9.67. The capital requirement for flood risk shall be equal to the following :

$$SCR_{flood} = \sqrt{\left(\sum_{(r,s)} CorrFL_{(r,s)} \cdot SCR_{(flood,r)} \cdot SCR_{(flood,s)} \right) + SCR_{(flood,other)}^2}$$

where:

- (a) the sum includes all possible combinations (r,s) of the regions set out in Annex Q;
- (b) $CorrFL_{(r,s)}$ denotes the correlation coefficient for flood risk for region r and region s as set out in Annex Q;
- (c) $SCR_{(flood,r)}$ and $SCR_{(flood,s)}$ denote the capital requirements for flood risk in region r and s respectively;
- (d) $SCR_{(flood,other)}$ denotes the capital requirement for flood risk in regions other than those set out in Annex O.

SCR.9.68. For all regions set out in Annex Q, the capital requirement for flood risk in a particular region r shall be the larger of the capital requirement for flood risk in region r according to scenario A and the capital requirement for flood risk in region r according to scenario B:

$$SCR_{(flood,r)} = \max(SCR_{(flood,r,A)}; SCR_{(flood,r,B)})$$

SCR.9.69. For all regions set out in Annex Q, the capital requirement for flood risk in a particular region r according to scenario A shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from a sequence of events:

$$SCR_{(flood,r,A)} = \Delta BOF | flood_{(A,r)} = \Delta BOF | flood_{(A,r)}$$

where

- ΔBOF = Change in the value of basic own funds
- $flood_{(A,r)}$ = Instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 65 % of the specified flood loss in region r followed by a loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 45 % of the specified flood loss in region r .

SCR.9.70. For all regions set out in Annex Q, the capital requirement for flood risk in a particular region r according to scenario B shall be equal to the loss in basic own

funds of insurance and reinsurance undertakings that would result from a sequence of events:

$$SCR_{(flood,r,B)} = \Delta BOF | flood_{(B,r)}$$

where

ΔBOF	=	Change in the value of basic own funds
$flood_{(B,r)}$	=	Instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 100 % of the specified flood loss in region r followed by a loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 10 % of the specified flood loss in region r .

SCR.9.71. Undertakings shall base the calculation of the capital requirement on the following assumptions:

- (a) the two consecutive events referred in SCR.9.73 and SCR.9.74 are independent;
- (b) undertakings do not enter into new insurance risk mitigation techniques between the two events.

SCR.9.72. Where current reinsurance contracts allow for reinstatements, insurance and reinsurance undertakings shall take into account future management actions in relation to the reinstatements between the first and the second event. The assumptions about future management actions should be realistic, objective and verifiable.

SCR.9.73. For all regions set out in Annex Q, the specified flood loss in a particular region r shall be equal to the following amount:

$$L_{(flood,r)} = Q_{(flood,r)} \cdot \sqrt{\sum_{(i,j)} Corr_{(flood,r,i,j)} \cdot WSI_{(flood,r,i)} \cdot WSI_{(flood,r,j)}}$$

where:

- (a) $Q_{(flood,r)}$ denotes the flood risk factor for region r as set out in Annex Q;
- (b) the sum includes all possible combinations of flood zones (i,j) ;
- (c) $Corr_{(flood,r,i,j)}$ denotes the correlation coefficient for flood risk in flood zones i and j of region r ;
- (d) $WSI_{(flood,r,i)}$ and $WSI_{(flood,r,j)}$ denote the weighted sums insured for flood risk in flood zones i and j of region r .

SCR.9.74. For all regions set out in Annex Q and all flood zones, the weighted sum insured for flood risk in a particular flood zone i of a particular region r shall be equal to the following:

$$WSI_{(flood,r,i)} = W_{(flood,r,i)} \cdot SI_{(flood,r,i)}$$

where:

- (a) $W_{(flood,r,i)}$ denotes the risk weight for flood risk in flood zone i of region r ;
- (b) $SI_{(flood,r,i)}$ denotes the sum insured for flood risk in flood zone i of region r .

SCR.9.75. For all regions set out in Annex Q and all flood zones, the sum insured for a particular flood zone i of a particular region r shall be equal to the following:

$$SI_{(flood,r,i)} = SI_{(property,r,i)} + SI_{(onshore-property,r,i)} + 1.5 \cdot SI_{(motor,r,i)}$$

SCR.9.76. For all regions set out in Annex Q, the flood zones of a particular region referred to in point (b) of paragraph 5 shall be made up of geographical divisions of the region which are sufficiently homogeneous in relation to the flood risk that the insurance and reinsurance undertakings are exposed to in relation to the region. Together the zones shall comprise the whole region. The zones shall be mutually exclusive of one another. Where the region itself is sufficiently homogeneous in relation to flood risk, that region shall be the flood zone.

SCR.9.77. For all regions set out in Annex Q and all flood zones of those regions, the risk weight for flood risk $W_{(flood,r,i)}$ in a particular flood zone i of a particular region r referred to in paragraph 6 shall be specified in such a way that the product of $W_{(flood,r,i)}$ and the flood risk factor $Q_{(flood,r)}$ for region r corresponds to the annual loss caused by flood in zone i of region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover flood risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.78. For all regions set out in Annex Q and all combinations (i,j) of two flood zones of one of those regions, the correlation coefficient $Corr_{(flood,r,i,j)}$ for flood risk in particular flood zones i and j of a particular region r shall be selected from one of the following figures: 0, 0.25, 0.5, 0.75 or 1. The correlation coefficient shall be selected in such a way that:

- (a) it reflects the dependency between flood risk in zones i and j , taking into account any non-linearity of the dependence;
- (b) it results in a specified flood loss $L_{(flood,r)}$ that corresponds to the annual loss caused by flood in region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover flood risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.79. The capital requirement for flood risk in regions other than those set out in Annex O, shall be equal to the loss in basic own funds of insurance and reinsurance

undertakings that would result from an instantaneous loss in relation to each insurance and reinsurance contract that covers one or more of the following insurance or reinsurance obligations:

- (a) obligations of lines of business 7 or 19 as set out in Annex K that cover flood risk, where the risk is not situated in one of the regions set out in Annex O;
- (b) obligations of lines of business 6 or 18 as set out in Annex K in relation to onshore property damage by flood, where the risk is not situated in one of the regions set out in Annex O;
- (c) obligations of lines of business 5 or 17 as set out in Annex K that cover flood risk, where the risk is not situated in one of the regions set out in Annex O.

SCR.9.80. The amount of the instantaneous loss, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, referred to in SCR.9.83 shall be equal to the following amount:

$$L_{(flood,other)} = 1.1 \cdot (0.5 \cdot DIV_{flood} + 0.5) \cdot P_{flood}$$

where DIV_{flood} is calculated in accordance with SCR.9.33, but based on the premiums in relation to the obligations referred to in SCR.9.83 and restricted to the regions 5 to 18 set out in Annex L.

Hail risk

Input

SCR.9.81. The following input information is required:

$SI_{(property,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 7 and 19 as set out in Annex K in relation to contracts that cover hail risk, where the risk is situated in hail zone i of region r

$SI_{(onshore-property,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 6 and 18 as set out in Annex K in relation to contracts that cover onshore property damage by hail risk, where the risk is situated in hail zone i of region r

$SI_{(motor,r,i)}$ = Sum insured by the insurance or reinsurance undertaking for insurance or reinsurance obligations for lines of business 5 and 17 as set out in Annex K in relation to contracts that cover hail risk, where the risk is situated in hail zone i of region r

$WSI_{(hail,r,i)}$ = Weighted sums insured for hail risk in hail zones i and j of region r

P_{hail} = Estimate of the premiums to be earned by the insurance or reinsurance undertaking for each contract that covers

the obligations referred to in SCR.9.98 during the following 12 months; for this purpose premiums shall be gross, without deduction of premiums for reinsurance contracts

Calculation

SCR.9.82. The capital requirement for hail risk shall be equal to the following:

$$SCR_{hail} = \sqrt{\left(\sum_{(r,s)} CorrHL_{(r,s)} \cdot SCR_{(hail,r)} \cdot SCR_{(hail,s)} \right) + SCR_{(hail,other)}^2}$$

where:

- (a) the sum includes all possible combinations (r,s) of the regions set out in Annex R;
- (b) $CorrHL_{(r,s)}$ denotes the correlation coefficient for hail risk for region r and region s as set out in Annex R;
- (c) $SCR_{(hail,r)}$ and $SCR_{(hail,s)}$ denote the capital requirements for hail risk in regions r and s respectively;
- (d) $SCR_{(hail,other)}$ denotes the capital requirement for hail risk in regions other than those set out in Annex O.

SCR.9.83. For all regions set out in Annex R, the capital requirement for hail risk in a particular region r shall be the larger of the capital requirement for hail risk in region r according to scenario A and the capital requirement for hail risk in region r according to scenario B:

$$SCR_{(hail,r)} = \max(SCR_{(hail,r,A)}; SCR_{(hail,r,B)})$$

SCR.9.84. For all regions set out in Annex R, the capital requirement for hail risk in a particular region r according to scenario A shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from a sequence of events:

$$SCR_{(hail,A,r)} = \Delta BOF | hail_{(A,r)}$$

where

ΔBOF	=	Change in the value of basic own funds
$hail_{(A,r)}$	=	Instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 70 % of the specified hail loss in region r followed by a loss of an amount that,

without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 50 % of the specified hail loss in region *r*.

SCR.9.85. For all regions set out in Annex R, the capital requirement for hail risk in a particular region *r* according to scenario B shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from a sequence of events:

$$SCR_{(hail,A,r)} = \Delta BOF | hail_{(B,r)}$$

where

ΔBOF	=	Change in the value of basic own funds
$hail_{(B,r)}$	=	Instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 100 % of the specified hail loss in region <i>r</i> followed by a loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 20 % of the specified hail loss in region <i>r</i>

SCR.9.86. Undertakings shall base the calculation of the capital requirement on the following assumptions:

- (a) the two consecutive events referred in SCR.9.76 and SCR.9.77 are independent;
- (b) undertakings do not enter into new insurance risk mitigation techniques between the two events.

SCR.9.87. Where current reinsurance contracts allow for reinstatements, insurance and reinsurance undertakings shall take into account future management actions in relation to the reinstatements between the first and the second event. The assumptions about future management actions should be realistic, objective and verifiable.

SCR.9.88. For all regions set out in Annex R, the specified hail loss in a particular region *r* shall be equal to the following amount:

$$L_{(hail,r)} = Q_{(hail,r)} \cdot \sqrt{\sum_{(i,j)} Corr_{(hail,r,i,j)} \cdot WSI_{(hail,r,i)} \cdot WSI_{(hail,r,j)}}$$

where:

- (a) $Q_{(hail,r)}$ denotes the hail risk factor for region *r* as set out in Annex R;

- (b) the sum includes all possible combinations of hail zones (i,j) ;
- (c) $Corr_{(hail,r,i,j)}$ denotes the correlation coefficient for hail risk in hail zones i and j of region r ;
- (d) $WSI_{(hail,r,i)}$ and $WSI_{(hail,r,j)}$ denote the weighted sums insured for hail risk in hail zones i and j of region r .

SCR.9.89. For all regions set out in Annex R and all hail zones, the weighted sum insured for hail risk in a particular hail zone i of a particular region r shall be equal to the following:

$$WSI_{(hail,r,i)} = W_{(hail,r,i)} \cdot SI_{(hail,r,i)}$$

where:

- (a) $W_{(hail,r,i)}$ denotes the risk weight for hail risk in hail zone i of region r ;
- (b) $SI_{(hail,r,i)}$ denotes the sum insured for hail risk in hail zone i of region r .

SCR.9.90. For all regions set out in Annex R and all hail zones, the sum insured for hail risk in a particular hail zone i of a particular region r shall be equal to the following:

$$SI_{(hail,r,i)} = SI_{(property,r,i)} + SI_{(onshore-property,r,i)} + 5 \cdot SI_{(motor,r,i)}$$

SCR.9.91. For all regions set out in Annex R, the hail zones of a particular region referred to in point (b) of paragraph 5 shall be made up of geographical divisions of the region which are sufficiently homogeneous in relation to the hail risk that the insurance and reinsurance undertakings are exposed to in relation to the region. Together the zones shall comprise the whole region. The zones shall be mutually exclusive of one another. Where the region itself is sufficiently homogeneous in relation to hail risk, that region shall be the hail zone.

SCR.9.92. For all regions set out in Annex R and all hail zones of those regions, the risk weight for hail risk $W_{(hail,r,i)}$ in a particular hail zone i of a particular region r referred to in paragraph 6 shall be specified in such a way that the product of $W_{(hail,r,i)}$ and the hail risk factor $Q_{(hail,r)}$ for region r correspond to the annual loss caused by hail in zone i of region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover hail risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.93. For all regions set out in Annex R and all combinations (i,j) of two hail zones of one of those regions, the correlation coefficient $Corr_{(hail,r,i,j)}$ for hail risk in particular hail zones i and j of a particular region r shall be selected from one of the following figures: 0, 0.25, 0.5, 0.75 or 1. The correlation coefficient shall be selected in such a way that:

- (a) it reflects the dependency between hail risk in zone i and j , taking into account any non-linearity of the dependence;

- (b) it results in a specified hail loss $L_{(hail,r)}$ that corresponds to the annual loss caused by hail in region r in relation to line of business 7 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 in relation to contracts that cover hail risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.94. The capital requirement for hail risk in regions other than those set out in Annex O, shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss in relation to each insurance and reinsurance contract that covers one or more of the following insurance or reinsurance obligations:

- (a) obligations of lines of business 7 or 19 as set out in Annex K that cover hail risk, where the risk is not situated in one of the regions set out in Annex O;
- (b) obligations of lines of business 6 or 18 as set out in Annex K in relation to onshore property damage by hail, where the risk is not situated in one of the regions set out in Annex O;
- (c) obligations of lines of business 5 or 17 as set out in Annex K that cover hail risk, where the risk is not situated in one of the regions set out in Annex O.

SCR.9.95. The amount of the instantaneous loss, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, referred to in SCR.9.98 shall be equal to the following amount:

$$L_{(hail,other)} = 0.3 \cdot (0.5 \cdot DIV_{hail} + 0.5) \cdot P_{hail}$$

where DIV_{hail} is calculated in accordance with SCR.9.33, but based on the premiums in relation to the obligations referred to in SCR.9.98 and restricted to the regions 5 to 18 set out in Annex L.

Subsidence risk

Input

SCR.9.96. The following input information is required:

$SI_{(subsidence,i)}$ = Sum insured by the insurance or reinsurance undertaking for lines of business 7 and 19 as set out in Annex L in relation to contracts that cover subsidence risk of residential buildings in subsidence zone i .

$WSI_{(subsidence,i)}$ = Weighted sum insured for subsidence risk in subsidence zone i

Calculation

SCR.9.97. The capital requirement for subsidence risk shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to the following amount:

$$L_{\text{subsidence}} = 0.0005 \cdot \sqrt{\sum_{(i,j)} \text{Corr}_{(\text{subsidence},i,j)} \cdot \text{WSI}_{(\text{subsidence},i)} \cdot \text{WSI}_{(\text{subsidence},j)}}$$

where:

- (a) the sum includes all possible combinations of subsidence zones (i,j) ;
- (b) $\text{Corr}_{(\text{subsidence},i,j)}$ denotes the correlation coefficient for subsidence risk in subsidence zones i and j ;
- (c) $\text{WSI}_{(\text{subsidence},i)}$ and $\text{WSI}_{(\text{subsidence},j)}$ denote the weighted sums insured for subsidence risk in subsidence zones i and j .

SCR.9.98. For all subsidence zones the weighted sum insured for subsidence risk in a particular subsidence zone i shall be equal to the following:

$$\text{WSI}_{(\text{subsidence},i)} = W_{(\text{subsidence},i)} \cdot \text{SI}_{(\text{subsidence},i)}$$

where:

- (a) $W_{(\text{subsidence},i)}$ denotes the risk weight for subsidence risk in subsidence zone i ;
- (b) $\text{SI}_{(\text{subsidence},i)}$ denotes the sum insured of the insurance or reinsurance undertaking for lines of business 7 and 19 as set out in Annex K in relation to contracts that cover subsidence risk of residential buildings in subsidence zone i .

SCR.9.99. The subsidence zones referred to in point (a) of SCR.9.101 shall be made up of geographical divisions of the territory of the French Republic which are sufficiently homogeneous in relation to the subsidence risk that the insurance and reinsurance undertakings are exposed to in relation to the territory. Together the zones shall comprise the whole territory. The zones shall be mutually exclusive of one another. Where the territory of the French Republic itself is sufficiently homogeneous in relation to subsidence risk, that region shall be the subsidence zone.

SCR.9.100. For all subsidence zones, the risk weight for subsidence risk $W_{(\text{subsidence},i)}$ in a particular subsidence zone i referred to in SCR.9.102 shall be specified in such a way that the product of $W_{(\text{subsidence},i)}$ and the subsidence risk factor 0.0005 corresponds to the annual loss caused by subsidence in zone i in relation to line of business 7 and 19 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 and 19 in relation to contracts that cover subsidence risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

SCR.9.101. For all combinations (i,j) of two subsidence zones, the correlation coefficient $\text{Corr}_{(\text{subsidence},i,j)}$ for subsidence risk in particular subsidence zones i and j shall be

selected from one of the following figures: 0, 0.25, 0.5, 0.75 or 1. The correlation coefficient shall be selected in such a way that:

- (a) the correlation coefficient reflects the dependency between subsidence risk in zone i and j , taking into account any non-linearity of the dependence;
- (b) it results in a specified subsidence loss $L_{\text{subsidence}}$ that corresponds to the annual loss caused by subsidence in relation to line of business 7 and 19 as set out in Annex K, expressed as a portion of the sum insured for line of business 7 and 19 in relation to contracts that cover subsidence risk, and calibrated using a Value-at-Risk measure with a 99.5 % confidence level.

Catastrophe risk of non-proportional property reinsurance

Input

SCR.9.102. The following input information is required:

$P_{NP\text{property}}$ = Estimate of the premiums to be earned by the insurance or reinsurance undertaking for each contract that covers the reinsurance obligations of line of business 28 as set out in Annex K other than non-proportional reinsurance obligations relating to insurance obligations included in lines of business 9 as set out in Annex K; for this purpose premiums shall be gross, without deduction of premiums for reinsurance contracts

SCR.9.103. The capital requirement for catastrophe risk of non-proportional property reinsurance shall be equal to an instantaneous loss in relation to each reinsurance contract that covers reinsurance obligations of line of business 28 as set out in Annex K

SCR.9.104. other than non-proportional reinsurance obligations relating to insurance obligations included in lines of business 9 as set out in Annex K:

$$SCR_{(NP\text{property})} = \Delta BOF | L_{npproperty},$$

$$L_{npproperty} = 2.5 \cdot (0.5 \cdot DIV_{npproperty} + 0.5) \cdot P_{npproperty}$$

where $DIV_{npproperty}$ is calculated in accordance with SCR.9.33, but based on the premiums earned by the insurance and reinsurance undertaking in line of business 28 as set out in Annex K, other than non-proportional reinsurance obligations relating to insurance obligations included in lines of business 9 as set out in Annex K, and restricted to the non-European regions 5 to 18 set out in Annex L.

Man-made catastrophe risk

Description

SCR.9.105. Man-Made Catastrophes: extreme or exceptional events arising from:

- Motor
- Fire
- Marine
- Aviation
- Liability
- Credit & Suretyship

Input

SCR.9.106. The following input information is required:

CAT_{Motor}	=	Catastrophe capital requirement for Motor vehicle liability sub-module
CAT_{Marine}	=	Catastrophe capital requirement for Marine risk sub-module
$CAT_{Aviation}$		Catastrophe capital requirement for Aviation risk sub-module
CAT_{Fire}	=	Catastrophe capital requirement for Fire risk sub-module
$CAT_{Liability}$	=	Catastrophe capital requirement for Liability risk sub-module
CAT_{Credit}	=	Catastrophe capital requirement for Credit and Suretyship risk sub-module

Output

SCR_{nmCAT}	=	Capital requirements for man-made catastrophe risk sub-module
---------------	---	---

Calculation

SCR.9.107. The capital requirement for the man-made catastrophe risk shall be equal to the following:

$$SCR_{nmCAT} = \sqrt{\sum_i SCR_i^2}$$

where the sum includes all sub-modules set out in paragraph 1 and SCR_i denotes the capital requirements for sub-module i .

Motor vehicle liability risk

Input

SCR.9.108. The following input information is required:

N_a = Number of vehicles insured by the insurance or

reinsurance undertaking in lines of business 4 and 16 as set out in Annex K with a deemed policy limit above 24 000 000 euro

N_b = Number of vehicles insured by the insurance or reinsurance undertaking in lines of business 4 and 16 as set out in Annex K with a deemed policy limit below or equal to 24 000 000 euro

Output

$SCR_{motorCAT}$	=	Capital requirements for Motor vehicle liability risk sub-module
------------------	---	--

Calculation

SCR.9.109. The capital requirement for the man-made catastrophe risk shall be equal to the following the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles is equal to:

$$SCR_{motorCAT} = \Delta BOF | L_{motor}$$

$$L_{motor} = 50000 \cdot \max\left(120, (N_a + 0.95 \cdot \min(20000, N_b) + 0.05 \cdot N_b)^{\frac{1}{2}}\right)$$

SCR.9.110. The number of motor vehicles covered by the proportional reinsurance obligations of the insurance or reinsurance undertaking shall be weighted by the relative share of the undertaking's obligations in respect of the sum insured of the motor vehicles.

SCR.9.111. The deemed policy limit referred to in paragraph 1 shall be the overall limit of the motor vehicle liability insurance policy or, where no such overall limit is specified in the terms and conditions of the policy, the sum of the limits for damage to property and for personal injury. Where the policy limit is specified as a maximum per victim, the deemed policy limit shall be based on the assumption of ten victims.

Marine risk

Input

SCR.9.112. The following input information is required:

$SI_{(hull,t)}$ = Sum insured by the insurance or reinsurance undertaking for marine hull insurance and reinsurance in relation to tanker t

$SI_{(liab,t)}$ = Sum insured by the insurance or reinsurance undertaking for marine liability insurance and reinsurance in relation to tanker t

$SI_{(pollution,t)}$ = Sum insured by the insurance or reinsurance undertaking for oil pollution insurance and reinsurance in relation to tanker t

SI_p = Accumulated sum insured by the insurance or reinsurance undertaking for the following insurance and reinsurance obligations in relation to platform p :

obligations to compensate for property damage;

obligations to compensate for the expenses for the removal of wreckage;

obligations to compensate for loss of production income;

obligations to compensate for the expenses for capping of the well or making the well secure;

liability insurance and reinsurance obligations.

Output

SCR_{marine}	=	Capital requirements for Marine risk sub-module
----------------	---	---

Calculation

SCR.9.113. The capital requirement for marine risk shall be equal to the following:

$$SCR_{marine} = \sqrt{SCR_{tanker}^2 + SCR_{platform}^2}$$

where SCR_{tanker} is the capital requirement for the risk of a tanker collision and $SCR_{platform}$ is the capital requirement for the risk of a platform explosion.

SCR.9.114. The capital requirement for the risk of a tanker collision shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to:

$$SCR_{tanker} = \Delta BOF | L_{tanker}$$

$$L_{tanker} = \max_t (SI_{(hull,t)} + SI_{(liab,t)} + SI_{(pollution,t)})$$

where the maximum relates to all oil and gas tankers insured by the insurance or reinsurance undertaking in respect of tanker collision in lines of business 6, 18 and 27 as set out in Annex K.

SCR.9.115. The capital requirement for the risk of a platform explosion shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would

result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to the following:

$$L_{platform} = \max_p(SI_p)$$

where the maximum relates to all oil and gas offshore platforms insured by the insurance or reinsurance undertaking in respect of platform explosion in lines of business 6, 18 and 27 as set out in Annex K.

Aviation risk

Input

SCR.9.116. The following input information is required:

SI_a = Sum insured by the insurance or reinsurance undertaking for aviation hull insurance and reinsurance and aviation liability insurance and reinsurance in relation to aircraft a

SCR.9.117. Output

$SCR_{aviation}$	=	Capital requirements for Aviation risk sub-module
------------------	---	---

Calculation

SCR.9.118. The capital requirement for aviation risk shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to:

$$SCR_{aviation} = \Delta BOF | L_{aviation}$$

$$L_{aviation} = \max_a(SI_a)$$

where the maximum relates to all aircrafts insured by the insurance or reinsurance undertaking in lines of business 6, 18 and 27 as set out in Annex K.

Fire risk

Input

SCR.9.119. The following input information is required:

SI_a = Largest fire risk concentration of the undertaking (set of buildings with the largest sum insured that meets the following conditions:

the undertaking has insurance or reinsurance obligations in lines of business 7 and 19 as set out in

Annex K, in relation to each building which cover damage due to fire or explosion, including as a result of terrorist attacks.

all buildings are partly or fully located within a radius of 200 meters).

SCR.9.120. Output

$SCR_{aviation}$	=	Capital requirements for Fire risk sub-module
------------------	---	---

Calculation

SCR.9.121. The capital requirement for fire risk shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to:

$$SCR_{aviation} = \Delta BOF | L_{fire},$$

$$L_{fire} = SI_a$$

SCR.9.122. The set of buildings may be covered by one or several insurance or reinsurance contracts.

Liability risk

Input

SCR.9.123. The following input information is required:

$P_{(liability,i)}$ = (a) Premiums earned by the insurance or reinsurance undertaking during the last 12 months in relation to insurance and reinsurance obligations in liability risk group i ; for this purpose premiums shall be gross, without deduction of premiums for reinsurance contracts

$Lim_{(i,1)}$ = Largest liability limit of indemnity provided by the insurance or reinsurance undertaking in liability risk group i

SCR.9.124. Output

$SCR_{liability}$	=	Capital requirements for Liability risk sub-module
-------------------	---	--

Calculation

SCR.9.125. The capital requirement for liability risk shall be equal to:

$$SCR_{liability} = \sqrt{\sum_{(i,j)} Corr_{(liability,i,j)} \cdot SCR_{(liability,i)} \cdot SCR_{(liability,j)}}$$

where:

- (a) the sum includes all possible combinations of liability risk groups (i,j) ;
- (b) $Corr_{(liability,i,j)}$ denotes the correlation coefficient for liability risk of liability risk groups i and j ;
- (c) $SCR_{(liability,i)}$ denotes the capital requirement for liability risk of liability risk group i .

SCR.9.126. Liability risk groups are defined as follows:

- (1) **Professional malpractice liability insurance obligations;** liability insurance obligations included in line of business 8 as set out in Annex K which cover liabilities arising out of professional practice in relation to clients and patients;
- (2) **Employers liability insurance obligations;** liability insurance obligations included in line of business 8 as set out in Annex K which cover liabilities of employers arising out of death, illness, accident, disability or infirmity of an employee in the course of the employment;
- (3) **Directors and officers insurance obligations;** liability insurance obligations included in line of business 8 as set out in Annex K which cover liabilities of directors and officers of a company, arising out of the management of that company, or losses of the company itself to the extent it indemnifies its directors and officers in relation to such liabilities.
- (4) **Personal liability insurance obligations;** liability insurance obligations included in line of business 8 as set out in Annex K which cover liabilities of natural persons in their capacity of private householders.

SCR.9.127. Liability risk correlation coefficients are given in the matrix below, where the headings of the rows and columns denote the numbers of the liability risk groups as defined in SCR.9.126:

$j \backslash i$	1	2	3	4	5
1	1	0	0.5	0.25	0.5
2	0	1	0	0.25	0.5
3	0.5	0	1	0.25	0.5
4	0.25	0.25	0.25	1	0.5
5	0.5	0.5	0.5	0.5	1

SCR.9.128. For all liability risk groups set out in SCR.9.124 the capital requirement for liability risk of a particular liability risk group i shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to:

$$SCR_{(liability,i)} = \Delta BOF | L_{(liability,i)}$$

$$L_{(liability,i)} = f_{(liability,i)} \cdot P_{(liability,i)}$$

Where $f_{(liability,i)}$ denotes the risk factor for liability risk group i as set out below:

I	Liability risk group i	$f_{(liability,i)}$
1	Professional malpractice liability insurance and proportional reinsurance obligations other than professional malpractice liability insurance and reinsurance for self-employed craftspersons or artisans	100 %
2	Employers liability insurance and proportional reinsurance obligations	160 %
3	Directors and officers liability insurance and proportional reinsurance obligations	160 %
4	Liability insurance and reinsurance obligations included in lines of business 8 and 20 as set out in Annex K, other than obligations included in liability risk groups 1 to 3 and other than personal liability insurance and proportional reinsurance and other than professional malpractice liability insurance and reinsurance for self-employed craftspersons or artisans	100 %
5	Non-proportional reinsurance of obligations relating to insurance obligations included in line of business 8 as set out in Annex K	210 %

SCR.9.129. The calculation of the loss in basic own funds shall be based on the following assumptions:

- (a) the loss of liability risk group i is caused by n_i claims, where n_i is equal to the lowest integer that exceeds the following amount:

$$\frac{f_{(liability,i)} \cdot P_{(liability,i)}}{1.15 \cdot Lim_{(i,1)}}$$

- (b) where undertaking provides unlimited cover in liability risk group i , the number of claims n_i is equal to 1;

- (c) the losses caused by the n_i claims are representative for the business of the insurance or reinsurance undertaking in liability risk group i and sum up to the loss of liability risk group i .

Credit and Suretyship risk

Input

SCR.9.130. The following input information is required:

$SI_{default}$ = Two largest credit insurance exposures

$P_{recession}$ = Premiums earned by the insurance or reinsurance undertaking during the last 12 months in lines of business 9 and 21

Output

SCR_{credit}	=	Capital requirements for Credit and Suretyship risk sub-module
----------------	---	--

Calculation

SCR.9.131. The capital requirement for credit and suretyship risk shall be equal to the following:

$$SCR_{credit} = \sqrt{SCR_{default}^2 + SCR_{recession}^2}$$

where $SCR_{default}$ is the capital requirement for the risk of a large credit default and $SCR_{recession}$ is the capital requirement for recession risk.

SCR.9.132. The capital requirement for the risk of a large credit default shall be equal to the loss in basic own funds of insurance and reinsurance undertakings that would result from an instantaneous default of the two largest credit insurance exposures of an insurance or reinsurance undertaking:

$$SCR_{default} = \Delta BOF | L_{default}$$

where

ΔBOF = Change in the value of basic own funds

$L_{default}$ = Assumption that the loss-given-default, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, of each credit insurance exposure is 10 % of the sum insured in relation to the exposure

SCR.9.133. The determination of the two largest credit insurance exposures of the insurance or reinsurance undertaking referred to in paragraph 2 shall be based on a comparison of the net loss-given-default of the credit insurance exposures, being the

loss-given-default after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles.

SCR.9.134. The capital requirement for recession risk shall be equal to:

$$SCR_{recession} = \Delta BOF | L_{recession}$$

where

ΔBOF	=	Change in the value of basic own funds
$L_{recession}$	=	Instantaneous loss of an amount that, without deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, is equal to 100 % of the premiums earned by the insurance or reinsurance undertaking during the last 12 months in lines of business 9 and 21

Other non-life catastrophe risk

Input

SCR.9.135. The following input information is required:

P_i	=	Estimate of the gross premium, without deduction of the amounts recoverable from reinsurance contracts, expected to be earned by the insurance or reinsurance undertaking during the following 12 months in relation to the groups of insurance and reinsurance obligations
-------	---	---

SCR.9.136. Output

SCR_{other}	=	Capital requirements for other non-life catastrophe risk sub-module
---------------	---	---

Calculation

SCR.9.137. The capital requirement for other non-life catastrophe risk shall be equal to:

$$SCR_{other} = \Delta BOF | L_{other},$$

$$L_{other} = \sqrt{(c_1 \cdot P_1 + c_2 \cdot P_2)^2 + (c_3 \cdot P_3)^2 + (c_4 \cdot P_4)^2 + (c_5 \cdot P_5)^2}$$

where c_1 , c_2 , c_3 , c_4 and c_5 denote the risk factors for the groups of insurance and reinsurance obligations 1 to 5 set out below:

<i>i</i>	Group of insurance and reinsurance obligations <i>i</i>	Risk factor c_i
1	Insurance and reinsurance obligations included in lines of business 6 and 18 as set out in Annex K other than marine insurance and reinsurance and aviation insurance and reinsurance	100 %
2	Reinsurance obligations included in line of business 27 as set out in Annex K other than marine reinsurance and aviation reinsurance	250 %
3	Insurance and reinsurance obligations included in lines of business 12 and 24 as set out in Annex K, other than extended warranty insurance and reinsurance obligations provided that the portfolio of these obligations is highly diversified and these obligation do not cover the costs of product recalls	40 %
4	Reinsurance obligations included in line of business 26 as set out in Annex K other than general liability reinsurance	250 %
5	Non-proportional reinsurance obligations relating to insurance obligations included in lines of business 9 as set out in Annex K	250 %

SCR.9.138. For the purpose of group 3, 'extended warranty insurance obligation' means insurance obligations which cover the cost of repair or replacement in the event of a breakdown of a consumer good used by the individuals in a private capacity and which may also provide additional cover against eventualities such as accidental damage, loss or theft and assistance in setting up, maintaining and operating the good.

SCR.10. Ring- fenced funds

SCR.10.1. Introduction

SCR.10.1. This chapter deals with the treatment of ring-fenced funds for the purposes of the Quantitative Assessment. It sets out the circumstances under which an adjustment has to be made to the own funds due to the existence of a ring-fenced fund and any consequential impact on the calculation of the Solvency Capital Requirement. It also sets out the approach for making these adjustments.

SCR.10.2. The undertaking has to perform the following steps in order to determine any adjustment to own funds in respect of ring-fenced funds:

- (a) The undertaking has to assess whether any own fund items have a reduced capacity to fully absorb losses on a going concern basis due to their lack of transferability within the undertaking as described in subsection SCR.10.3.
- (b) The undertaking has to identify all assets and liabilities and own funds subject to the arrangement giving rise to a ring-fenced fund in accordance with subsection SCR.10.4.
- (c) The undertaking has to calculate the notional Solvency Capital Requirement of a ring-fenced fund in accordance with subsection SCR.10.5. and subsection SCR.10.6. for the standard formula and subsection SCR.10.5. and subsection SCR.10.7. for an internal model calculation. The undertaking has to carry out these calculations before making any adjustment to own funds as set out in subsection SCR.10.8. to avoid any circularity in the calculation.
- (d) The undertaking has to compare the amount of the restricted own-fund items within the ring-fenced fund with the notional Solvency Capital Requirement of the ring-fenced fund, as described in subsection SCR.10.8.
- (e) The undertaking has to calculate the Solvency Capital Requirement of the undertaking as a whole in accordance with subsection SCR.10.9. for the standard formula and section SCR.10.10. for an internal model calculation. The undertaking has to carry out these calculations before making any adjustment to own funds as set out in section SCR.10.8. to avoid any circularity in the calculation.

SCR.10.2. Materiality

SCR.10.3. Where a ring-fenced fund is not material, the undertaking may, as an alternative to the approach set out in subsection SCR.10.8., exclude the total amount of restricted own-fund items from the amount of own-fund items eligible

to cover the Solvency Capital Requirement and the amount of basic own-fund items eligible to cover the Minimum Capital Requirement. In this case the undertaking does not have to calculate a notional Solvency Capital Requirement. The materiality of a ring-fenced fund is assessed by reference to:

- (i) the nature of the risks arising from or covered by the ring-fenced fund
- (ii) the amount of restricted own funds within the ring-fenced fund and the volatility of those amounts over time
- (iii) the proportion of the undertaking's total assets it represents, alone or combined with other ring-fenced funds
- (iv) the proportion of the undertaking's capital requirement it represents, alone or combined with other ring-fenced funds
- (v) the nature of the assets and liabilities within the ring-fenced fund
- (vi) whether a separate notional Solvency Capital Requirement should be required in any event owing to its likely impact on the calculation of the Solvency Capital Requirement of the undertaking as a whole under the standard formula

SCR.10.4.

SCR.10.3. Identification of a ring-fenced fund

SCR.10.5 A ring-fenced fund arises as a result of the restriction on a going concern basis of own funds items so that they can only be used to cover losses: (i) on a defined portion of the undertaking's insurance contracts, (ii) in respect of certain policyholders or beneficiaries, or (iii) arising from particular risks.

SCR.10.6. The undertaking has to identify the nature of any such restrictions affecting assets and own funds within its business and the liabilities in respect of the contracts, policyholders or risks for which such assets and own funds can be used. The assets and liabilities and own funds identified by this process constitute the ring-fenced fund. The existence of a restriction on assets in relation to liabilities which would lead to restricted own funds is the defining characteristic of a ring-fenced fund.

SCR.10.7. Profit participation is not a defining  characteristic of a ring-fenced fund but may be present as part of the arrangements. Ring-fenced funds may arise where profit participation forms part of the arrangement and also in the absence of profit participation.

SCR.10.8. While the ring-fenced assets and liabilities should form an identifiable unit in the same manner as though the ring-fenced fund were a separate undertaking, it is not necessary that these items are managed together as a separate unit or form a separate sub-fund for a ring-fenced fund to arise.

SCR.10.9. Where proceeds of or returns on the assets in the ring-fenced fund are also subject to the ring-fenced fund arrangement, they should be traceable at any given time,

i.e. the items need to be identifiable as covered by or subject to the arrangement giving rise to a ring-fenced fund.

SCR.10.10. Restrictions on assets giving rise to a ring-fenced fund might require arrangements for separate management to be put in place but this is not the defining characteristic.

SCR.10.11. Annex S lists arrangements and products that are generally outside the scope of ring-fenced funds.

SCR.10.12. Restrictions which give rise to a ring-fenced fund can arise in a number of ways, including by virtue of:

- (1) contractual terms in a policy or that apply to a number of policies
- (2) a separate legal arrangement that applies in addition to the terms of a policy
- (3) provisions in the articles of association or statutes of the undertaking
- (4) national legislation or regulations in respect of product design or the conduct of the relationship between undertakings and their policyholders: ring-fenced funds would arise where, as a result of legal provisions protecting the general good in a Member State, an insurance or reinsurance undertaking must apply particular assets only for the purposes of a particular part of its business
- (5) provisions of EU law, whether transposed or directly applicable
- (6) arrangements specified by order of a court or other competent authority which require separation of or restrictions on assets or own funds in order to protect one or more groups of policyholders

SCR.10.13. As a minimum, the undertaking has to compare arrangements within its business with the following types of ring-fenced funds as part of its identification of characteristics and restrictions giving rise to ring-fenced funds:

- (i) **With-profits:** This falls within the type of arrangements outlined in SCR.10.12. (i) and (iv). A fund of assets and liabilities in respect of profit participation ("with profits") business that is only available to cover losses arising in respect of particular policyholders or in relation to particular risks and where the following key features exist:
 - a. Policyholders within the ring-fenced fund have distinct rights relative to other business written by the insurer.
 - b. There are restrictions on the use of assets, and the return on such assets, within this fund to meet liabilities or losses arising outside the fund.
 - c. An excess of assets over liabilities is generally maintained within the fund and this excess is restricted own funds since its use is subject to the restrictions referred to above.
 - d. There is generally profit participation within the ring-fenced fund whereby policyholders receive a minimum proportion of the profits generated in the

fund which are distributed through additional benefits or lower premium, and, if relevant, shareholders may then receive the balance of such profits.

(ii) Legally binding arrangement or trust created for the benefit of policyholders.

This could fall within SCR.10.12. (i) or (ii), where, within or separate to the policy documentation, an agreement calls for certain proceeds or assets to be placed in trust or subject to a legally binding arrangement or charge for the benefit of the specified policyholders.

(iii) Provisions in the articles of association or statutes of the undertaking: The ring-fenced fund would reflect the restrictions on particular assets or own funds as specified in the articles of association or statutes of the undertaking.

(iv) National legislation: This covers the situation where a ring-fenced fund would arise to reflect the effect of restrictions or arrangements specified in national law.

(v) EU law: This will include arrangements falling within the scope of the Solvency II framework:

In the following cases the effect of various conditions which must be satisfied in order to qualify for the particular approach means that a ring-fenced fund arises:

- a. Article 304 of Directive 2009/138/EC: in relation to the provision of occupational retirement benefit business and retirement benefits paid by reference to reaching retirement²⁸ but having regard to the fact that Article 304 permits diversification effects being recognised provided that the interests of policyholders and beneficiaries in other member states are safeguarded. In all other cases of ring-fenced funds it should be assumed that no diversification effects exist between the ring-fenced fund and the rest of the undertaking;
- b. in relation to the use of a matching adjustment;
- c. Subsection SCR.8.4.: in relation to the treatment of certain health risk equalisation systems under the Health Underwriting Risk Module.

SCR.10.14 Examples for types of arrangement that give rise to ring-fenced funds according to national and EU legislation are provided in Annex T.

SCR.10.4. Identification of assets and liabilities in a ring-fenced fund

SCR.10.15. The assets in a ring-fenced fund are those arising from the investment of premiums received by the undertaking in relation to the policies which comprise the ring-fenced fund along with any other payments into and/or assets provided to the fund. Under different arrangements, the assets might comprise specific assets

²⁸ Retirement benefits paid by reference to reaching, or the expectation of reaching, retirement where the premiums paid for those benefits have a tax deduction which is authorised to policyholders in accordance with the national legislation of the Member State that has authorised the undertaking: Directive 2009/138/EC, Article 304 (1) (b).

or a pool of assets identified in the contractual arrangements giving rise to the ring-fenced fund.

SCR.10.16. The liabilities in a ring-fenced fund comprise those liabilities attributable to the policies or risks covered by the ring-fenced fund. This includes the technical provisions including any future discretionary benefits which the undertaking expects to pay. The undertaking has to attribute liabilities to the ring-fenced fund only where honouring such liabilities would entail an appropriate and permitted use of the restricted assets or own funds.

SCR.10.17. The methodology and assumptions applied in deriving the technical provisions, including future discretionary benefits, for the purposes of the ring-fenced fund calculations have to be the same as those used in respect of the same obligations in the calculation of technical provisions overall.

SCR.10.5. Calculation of notional Solvency Capital Requirements

SCR.10.18. Where ring-fenced funds exist, a notional Solvency Capital Requirement has to be calculated for each ring-fenced fund, as well as for the remaining part of the undertaking, in the same manner as if those ring-fenced funds and the remaining part of the undertaking were separate undertakings.

SCR.10.19. Where multiple ring-fenced funds within an undertaking exhibit similar characteristics, the calculation methodology applied to one ring-fenced fund may also be applied to any similar ring-fenced fund, provided the methodology produces sufficiently accurate results for all of the similar ring-fenced funds.

SCR.10.6. Calculation of notional Solvency Capital Requirements with the Standard Formula

SCR.10.20. The notional Solvency Capital Requirement of a ring-fenced fund is derived by applying the Standard Formula Solvency Capital Requirement calculation to those assets and liabilities within the ring-fenced fund as if it were a separate undertaking.

SCR.10.21. Where the calculation of the capital requirement for a risk module or sub-module of the Basic Solvency Capital Requirement is based on the impact of a scenario on the basic own funds of the undertaking, the impact of the scenario on the basic own funds at the level of the ring-fenced fund and the remaining part of the undertaking has to be calculated. The basic own funds at the level of the ring-fenced fund are those restricted own-fund items that meet the definition of basic own funds set out in Article 88 of Directive 2009/138/EC for that ring-fenced fund.

SCR.10.22. Where profit participation arrangements exist in the ring-fenced fund, the following additional requirements shall apply:

- a. Notwithstanding SCR.1.7., where the scenario-based calculation referred to in SCR.10.21. would result in an increase in the basic own funds at the level of the ring-fenced fund, the estimated change in those basic own funds is

adjusted to reflect the existence of profit participation arrangements in the ring-fenced fund. In this case, the adjustment to the change in the basic own funds of the ring-fenced fund is the amount by which technical provisions would increase due to the expected future distribution to policy holders or beneficiaries of that ring-fenced fund.

- b. Where the scenario-based calculation referred to in SCR.10.21. would result in a decrease in the basic own funds at the level of the ring-fenced fund, the estimated change in those basic own funds for the calculation of the net Basic Solvency Capital Requirement, as referred to in SCR.2.14., is adjusted to reflect the reduction in future discretionary benefits payable to policy holders or beneficiaries of that ring-fenced fund provided the requirements in TP.2.128.-TP.2.135. and TP.2.103.-TP.2.104. and TP.2.108.-TP.2.109. are met. The adjustment is limited by the amount of future discretionary benefits within the ring-fenced fund.

SCR.10.23. Notwithstanding SCR.10.18., the notional Solvency Capital Requirement for each ring-fenced fund is calculated using the scenario-based calculations under which basic own funds for the undertaking as a whole are most negatively affected.

SCR.10.24. For the purpose of determining the scenario under which basic own funds are most negatively affected for the undertaking as a whole, the undertaking has first to calculate the sum of the results of the impacts of the scenarios on the basic own funds at the level of each ring-fenced fund, in accordance with SCR.10.21. and SCR.10.22. The totals at the level of each ring-fenced fund are then added to one another and to the results of the impact of the scenarios on the basic own funds in the remaining part of the insurance or reinsurance undertaking.

SCR.10.25. In the case of bidirectional scenarios, if the worst case scenario produces a negative result for a particular capital charge, after taking into account any potential increase of liabilities due to profit participation mechanisms, and would therefore result in an increase in basic own funds within the fund then that charge is set to zero.

SCR.10.26. The capital requirement at the level of each ring-fenced fund is calculated net of the mitigating effect of future discretionary benefits. Where profit participation exists, the assumptions on the variation of future bonus rates have to be realistic and to have due regard to the impact of the shock at the level of the ring-fenced fund and to any contractual, legal or statutory requirements governing the profit participation mechanism. The relevant downward adjustment of the notional Solvency Capital Requirement for the loss-absorbing capacity of technical provisions is not to exceed, in relation to a particular ring-fenced fund, the amount of future discretionary benefits within that fund.

SCR.10.27. The notional Solvency Capital Requirement includes a capital requirement for operational risk as well as any relevant adjustments for the loss-absorbing capacity of technical provisions and deferred taxes.

SCR.10.28. The notional Solvency Capital Requirement for each ring-fenced fund is determined by aggregating the capital requirements under the scenario referred to in SCR.10.23. for each sub-module and risk module of the Basic Solvency Capital

Requirement using the procedure for aggregation of the standard formula prescribed by Articles 104 of Directive 2009/138/EC. Diversification of risks within the ring-fenced fund is therefore permitted.

SCR.10.7. Calculation of notional Solvency Capital Requirements with an internal model

SCR.10.29. The calculation of the notional Solvency Capital Requirement of a ring-fenced fund with the internal model has to be consistent with the calculation of the Solvency Capital Requirement for the undertaking as a whole. In particular,

- (i) the risk mitigation techniques and future management actions taken into account to calculate the notional Solvency Capital Requirement of the ring-fenced fund have to be consistent with the risk mitigation techniques and future management actions taken into account to calculate the Solvency Capital Requirement for the undertaking as a whole, and with SCR.10.26.
- (ii) the methodology and assumptions applied in calculating the notional Solvency Capital Requirement for the purposes of the ring-fenced fund have to be the same as those used in respect of the same assets, liabilities and risks in the calculation of the Solvency Capital Requirement for the undertaking as a whole.

SCR.10.8. Adjustments for ring-fenced funds

SCR.10.30 This section outlines the adjustment to own funds for ring-fenced funds. An example for these adjustments when the Standard Formula is used is provided in Annex U.

SCR.10.31. An adjustment to the reconciliation reserve in accordance with OF.7. (iv) is required for restricted own-fund items in a ring-fenced fund.

SCR.10.32. Without prejudice to the requirement set out in OF.7. that foreseeable dividends and distributions are excluded from the reconciliation reserve, the restricted own-fund items in a ring-fenced fund do not include the value of future transfers attributable to shareholders.

SCR.10.33. The undertaking has to adjust the reconciliation reserve in accordance with OF.7. (iv) to reflect the existence of ring-fenced funds by comparing the amount of the restricted own-fund items within the ring-fenced fund against:

- a. the notional Solvency Capital Requirement for that ring-fenced fund, calculated in accordance with the standard formula, or
- b. where the undertaking's Solvency Capital Requirement is calculated using an internal model, a notional Solvency Capital Requirement using that internal model, as if the undertaking pursued only the business included in the ring-fenced fund.

SCR.10.34. For each ring-fenced fund where the restricted own-fund items exceed the notional Solvency Capital Requirement for that ring-fenced fund, the amount of restricted own-fund items in excess of the notional Solvency Capital Requirement is excluded from the amount of own-fund items eligible to cover the Solvency Capital Requirement and the amount of basic own-fund items eligible to cover the Minimum Capital Requirement.

SCR.10.35. If the amount of own funds within a ring-fenced fund is equal to or less than the notional Solvency Capital Requirement of the ring-fenced fund, no adjustment to own funds is made. In this case, all of the own funds within the ring-fenced fund are available to meet the Solvency Capital Requirement and the Minimum Capital Requirement.

SCR.10.9. Calculation of the Solvency Capital Requirement for the undertaking as a whole with the Standard Formula

SCR.10.36. The Solvency Capital Requirement for the undertaking as a whole is the sum of the notional Solvency Capital Requirements for each ring-fenced fund and the notional Solvency Capital Requirement for the rest of the undertaking.

SCR.10.37. No diversification benefits among ring-fenced funds and/or between ring-fenced funds and the rest of the undertaking are reflected in the calculation other than in respect of ring-fenced funds under Article 304 of Directive 2009/138/EC and where conditions specified in that Article are met.

SCR.10.38. Any negative notional Solvency Capital Requirements is set to zero before being aggregated with any positive notional Solvency Capital Requirements of ring-fenced funds and the rest of the undertaking.

SCR.10.10. Deriving the Solvency Capital Requirement split by risk module when using the Standard Formula

The following principle is proposed to derive the SCR by risk module at entity level, when the undertaking has one or several ring fenced funds. The principle implies the following 2-step calculation in order to identify the effects of non-diversification due to the presence of ring fenced funds:

- 1st step: calculate the SCR of the entity “as if there were no RFF constraints” (full recognition of diversification effects)
- 2nd step: calculate the difference between the result of 1st step and the sum of notional SCRs, and allocate this difference between risk modules

As this approach implies possibly complex calculations, the effects of non-diversification may be quantified by using one of the following simplifications:

- Simplification 1: identify the effects of non-diversification between ring fenced funds at the level of each risk module, and reallocate these effects between risk modules.

- Simplification 2: identify the effects of non-diversification between ring fenced funds at the level of each risk sub-module, and reallocate these effects between risk modules.

SCR.10.11. Calculation of the Solvency Capital Requirement for the undertaking as a whole with the internal model

SCR.10.39 The system used for measuring diversification effects has to take into account any material restrictions of diversification which arise from the existence of ring-fenced funds.

DRAFT

SCR.11. Financial Risk mitigation

SCR.11.1. Scope

SCR.11.1. This subsection covers financial risk mitigation techniques. For the purposes of the Quantitative Assessment, financial risk mitigation techniques include the purchase or issuance of financial instruments (such as financial derivatives) which transfer risk to the financial markets.

SCR.11.2. The use of special purpose vehicles and reinsurance to mitigate underwriting risks are not considered to be financial risk mitigation techniques and are covered in subsection SCR.12.

SCR.11.3. The following are examples of financial risk mitigation techniques covered by this subsection:

- Put options bought to cover the risk of falls in the value of assets,
- Protection bought through credit derivatives or collateral to cover the risk of failure or downgrade in the credit quality of certain exposures,
- Currency swaps and forwards to cover currency risk in relation to assets or liabilities,
- Swaptions acquired to cover variable/fixed risks.

SCR.11.4. The allowance of the above financial risk mitigation techniques is subject to the requirements in this subsection and the principles in Annex I being met.

SCR.11.5. Financial risk mitigation techniques do not include the risk mitigating effect provided by discretionary profit participation. Processes and controls that an undertaking has in place to manage the investment risk are also excluded. This does not preclude the allowance for future management actions in the calculation of technical provisions subject to the requirements in section V.2.

SCR.11.2. Conditions for using financial risk mitigation techniques

SCR.11.6. The contractual arrangements and transfer of risk of the risk mitigation technique are legally effective and enforceable in all relevant jurisdictions

SCR.11.7. The insurance or reinsurance undertaking has taken all appropriate steps to ensure the effectiveness of the arrangement and to address the risks related to that arrangement.

SCR.11.8. The insurance or reinsurance undertaking is able to monitor the effectiveness of the arrangement and the related risks on an ongoing basis.

- SCR.11.9. The insurance or reinsurance undertaking has, in the event of a default, insolvency or bankruptcy of a counterparty or other credit event set out in the transaction documentation for the arrangement, a direct claim on that counterparty.
- SCR.11.10. The calculation of the SCR using the standard formula should allow for the effects of risk mitigation techniques through a reduction in requirements commensurate with the extent of risk mitigation and an appropriate treatment of any corresponding risks embedded in the use of financial risk mitigation techniques. These two effects should be separated.
- SCR.11.11. There should be no double counting of mitigation effects in both own funds and the calculation of the SCR or within the calculation of the SCR.
- SCR.11.12. Undertakings should not in their use of risk mitigation techniques anticipate the shocks considered in the SCR calculation. The SCR is intended to capture unexpected risks.
- SCR.11.13. The calculation should be made on the basis of assets and liabilities existing at the date of reference of the solvency assessment and the risk mitigating technique being in force for at least the next 12 months or in case it will be in force for a period shorter than 12 months it will be taken into account prorata temporis for the shorter of the full term of the risk exposure covered or the period that the risk mitigation technique is in force.
- SCR.11.14. Where contractual arrangements governing the risk-mitigation techniques will be in force for a period shorter than the next 12 months and the insurance or reinsurance undertaking intends to replace that risk-mitigation technique at the time of its expiry with a similar arrangement, the risk-mitigation technique shall be fully taken into account in the Basic Solvency Capital Requirement provided the following qualitative criteria are met:
- (a) the insurance or reinsurance undertaking has a written policy on the replacement of that risk-mitigation technique;
 - (b) the replacement of the risk-mitigation technique shall not take place more often than every three months;
 - (c) the replacement of the risk-mitigation technique is not conditional on any future event, which is outside of the control of the insurance or reinsurance undertaking. Where the replacement of the risk-mitigation technique is conditional on any future event, that is within the control of the insurance or reinsurance undertaking, then the conditions should be clearly documented in the written policy referred to in point (a);
 - (d) the replacement of the risk-mitigation technique shall be realistic based on replacements undertaken previously by the insurance or reinsurance undertaking and consistent with its current business practice and business strategy;
 - (e) the risk that the risk-mitigation technique cannot be replaced due to an absence of liquidity in the market is not material;
 - (f) the risk that the cost of replacing the risk-mitigation technique increases during the following 12 months is reflected in the Solvency Capital Requirement;

(g) the replacement of the risk-mitigation technique would not be contrary to requirements that apply to future management actions set out in section V.1.

SCR.11.15. With the exception of rolling hedging programmes see subsection SCR.11.5., risk mitigation techniques (for example financial stop-loss processes) not in place at the date of reference of the solvency assessment should not be allowed to reduce the calculation of the SCR with the standard formula.

SCR.11.16. The contractual arrangements governing the risk-mitigation technique shall ensure that the extent of the cover provided by the risk-mitigation technique and the transfer of risk is clearly defined and incontrovertible.

SCR.11.17. The contractual arrangement shall not result in material basis risk or in the creation of other risks .

SCR.11.18. Basis risk is material if it leads to a misstatement of the risk-mitigating effect on the insurance or reinsurance undertaking's Basic Solvency Capital Requirement that could influence the decision-making or judgement of the intended user of that information, including the supervisory authorities.

SCR.11.19. The determination that the contractual arrangements and transfer of risk is legally effective and enforceable in all relevant jurisdictions shall be based on the following:

(a) whether the contractual arrangement is subject to any condition which could undermine the effective transfer of risk, the fulfilment of which is outside the direct control of the insurance or reinsurance undertaking;

(b) whether there are any connected transactions which could undermine the effective transfer of risk.

SCR.11.3. Basis Risk

SCR.11.20. Where the underlying assets or references of the financial mitigation instrument do not perfectly match the exposures of the undertaking, the financial risk mitigation technique should only be allowed in the calculation of the SCR with the standard formula if the undertaking can demonstrate that the basis risk is not material compared to the mitigation effect. Undertakings shall consider that a risk-mitigation technique has not a material basis risk where the following three conditions are simultaneously met:

- (a) all risks derived from the risk-mitigation technique are adequately captured in the calculation of the Solvency Capital Requirement with the standard formula, and
- (b) the exposure covered by the risk-mitigation technique has a sufficiently similar nature to the risk exposure actually held by the undertaking, and
- (c) the changes in value of the exposure covered by the risk-mitigation technique closely mirror the changes in value of the risk exposure of the insurance or reinsurance undertaking under all scenarios considered in the relevant risk modules or sub-modules of the Solvency Capital Requirement.

Before allowing for a financial risk-mitigation technique in the calculation of the Solvency Capital Requirement with the standard formula, insurance and reinsurance undertakings shall ascertain that they are able to provide sufficient evidence on the fulfilment of the requirements according to the following principles:

- a) the materiality of the basis risk shall be assessed with reference to the exposure covered by the risk-mitigation technique and the risk exposure of the insurance or reinsurance undertaking, without considering other elements of the balance sheet, unless any other element keeps a continuous and necessary connection with the risk exposure of the undertaking,
- (b) the similarity of the nature of the exposures shall be assessed taking into account at least the type of instruments or arrangements involved, their terms and conditions, the rules governing the markets where their prices are derived, and a comparison with other risk-mitigation techniques having the same nature as the risk exposure of the insurance or reinsurance undertaking,
- (c) The assessment should refer to the behaviour of both exposures under the scenario considered in the relevant risk module or sub-module of the Solvency Capital Requirement, keeping in mind that such scenarios represent an event aimed to achieve the confidence level set out in Article 101(3) of Directive 2009/138/EC. In addition, the assessment shall allow at least for:
 - i. The degree of symmetry among both exposures;
 - ii. Any non-linear dependencies under the relevant scenario;
 - iii. Any relevant asymmetry of the behaviours in case of bi-directional scenarios;
 - iv. The levels of diversification of each respective exposure;
 - v. Any relevant risks not captured explicitly in the standard formula;
 - vi. The whole payout distribution applying to the risk-mitigation technique.

SCR.11.21. Where the assessment set out in SCR.11.21. results in a lack of sufficient evidence that the change in value of the exposure covered by the risk-mitigation technique will mirror at least 90 per cent of the change in value of the risk exposure of the insurance or reinsurance undertaking, insurance and reinsurance undertakings shall consider that the risk-mitigation technique has a material basis risk

SCR.11.22. Insurance and reinsurance undertakings shall in any case consider a risk-mitigation technique to have material basis risk where the risk-mitigation technique is not listed in regulated markets in countries which are members of the EEA or the OECD, and does not meet the requirements set out in the Community regarding risk-mitigation techniques for OTC derivatives not cleared by a CCP under the Regulation on OTC derivatives, CCPs and Trade Repositories [EMIR].

SCR.11.4. Credit quality of the counterparty

SCR.11.23. For the Quantitative Assessment purposes, only financial protection provided by counterparties with a credit quality step equal or equivalent to at least 3 should be allowed in the assessment of the SCR. For unrated counterparties, the undertaking should be able to demonstrate that the counterparty meets at least the standard of company with credit quality step of 3.

SCR.11.24. In the event of default, insolvency or bankruptcy of the provider of the financial risk mitigation instrument – or other credit events set out in the transaction document – the financial risk mitigation instrument should be capable of liquidation in a timely manner or retention.

SCR.11.25. If the financial risk mitigation technique is collateralized, the assessment of the credit quality of the protection should consider the collateral if the requirements set out in subsection SCR.11.8 are met and the risks arising from the collateral are appropriately captured in the SCR (i.e. the counterparty default risk module for standard formula users).

SCR.11.5. Credit derivatives

SCR.11.26. The reduction of the SCR based on the mitigation of credit exposures by using credit derivatives should only be allowed where undertakings have in force generally applied procedures for this purpose and consider generally admitted criteria. Requirements set out in other financial sectors for the same mitigation techniques may be considered as generally applied procedures and admitted criteria.

SCR.11.27. In order for a credit derivative contract to be recognised, the credit events specified by the contracting parties must at least cover:

- Failure to pay the amounts due under the terms of the underlying obligation that are in effect at the time of such failure (with a grace period that is closely in line with the grace period in the underlying obligation);
- Bankruptcy, insolvency or inability of the obligor to pay its debts, or its failure or admission in writing of its inability generally to pay its debts as they fall due, and analogous events; and
- Restructuring of the underlying obligation, involving forgiveness or postponement of principal, interest or fees that results in a credit loss event.

SCR.11.28. A mismatch between the underlying obligation and the reference obligation under the credit derivative or between the underlying obligation and the obligation used for purposes of determining whether a credit event has occurred is permissible only if the following conditions are met:

- the reference obligation or the obligation used for the purposes of determining whether a credit event has occurred, as the case may be, ranks pari passu with or is junior to the underlying obligation; and
- the underlying obligation and the reference obligation or the obligation used for the purposes of determining whether a credit event has occurred, as the case may be, share the same obligor (i.e. the same legal entity) and there are in place legally enforceable cross-default or cross-acceleration clauses.

SCR.11.6. Collateral

SCR.11.29. 'collateral arrangements' means arrangements under which either:

- (a) a collateral provider transfers full ownership of the collateral to the collateral taker for the purpose of securing or otherwise covering the performance of a relevant obligation; or
- (b) a collateral provider provides collateral by way of security in favour of, or to, a collateral taker, and the legal ownership of the collateral remains with the collateral provider or a custodian when the security right is established;

SCR.11.30. In the calculation of the Basic Solvency Capital Requirement, collateral arrangements shall only be recognised where, in addition to the requirements in SCR.11.6.-SCR.11.12., the following criteria are met:

- (a) the insurance or reinsurance undertaking transferring the risk shall have the right to liquidate or retain, in a timely manner, the collateral in the event of a default, insolvency or bankruptcy or other credit event of the counterparty;
- (b) there is sufficient certainty as to the protection achieved by the collateral because either:
 - (i) it is of sufficient credit quality, is of sufficient liquidity and is sufficiently stable in value, or
 - (ii) it is guaranteed by a counterparty, other than a counterparty referred to in SCR.5.133. who has been assigned a risk factor for spread risk of 0 %;
- (c) there is no material positive correlation between the credit quality of the counterparty and the value of the collateral;
- (d) the collateral is not securities issued by the counterparty or a related undertaking of that counterparty;

SCR.11.7. Segregation of assets

SCR.11.31. Where the liabilities of the counterparty are covered by strictly segregated assets under arrangements that ensure the same degree of protection as collateral arrangements then the segregated assets should be treated as if they were collateral with an independent custodian.

SCR.11.32. The segregated assets should be held with a deposit-taking institution with a credit quality step equal or equivalent to at least 3.

SCR.11.33. The segregated assets should be individually identifiable and should only be changed subject to the consent of the insurance or reinsurance undertaking.

SCR.11.34. The insurance or reinsurance undertaking should have a right to directly obtain ownership of the assets without any restriction, delay or impediment in the event of the default, insolvency or bankruptcy of the counterparty or other credit event set out in the transaction documentation.

SCR.12. Insurance risk mitigation

SCR.12.1. Scope

SCR.12.1. This subsection covers insurance risk mitigation techniques. For the purposes of the Quantitative Assessment, insurance risk mitigation techniques include the use of reinsurance contracts or special purpose vehicles to transfer underwriting risks.

SCR.12.2. Conditions for using insurance risk mitigation techniques

SCR.12.2. The contractual arrangements and transfer of risk of the risk mitigation technique are legally effective and enforceable in all relevant jurisdictions

SCR.12.3. The insurance or reinsurance undertaking has taken all appropriate steps to ensure the effectiveness of the arrangement and to address the risks related to that arrangement. The mere fact that the probability of a significant variation in either the amount or timing of payments by the insurance, reinsurance undertaking or SPV is remote does not by itself mean that the insurance, reinsurance undertaking or SPV has not assumed risk

SCR.12.4. The insurance or reinsurance undertaking is able to monitor the effectiveness of the arrangement and the related risks on an ongoing basis.

SCR.12.5. The insurance or reinsurance undertaking has, in the event of a default, insolvency or bankruptcy of a counterparty or other credit event set out in the transaction documentation for the arrangement, a direct claim on that counterparty.

SCR.12.6. The calculation of the SCR using the standard formula should allow for the effects of risk mitigation techniques through a reduction in requirements commensurate with the extent of risk mitigation and an appropriate treatment of any corresponding risks embedded in the use of financial risk mitigation techniques. These two effects should be separated.

SCR.12.7. There should be no double counting of mitigation effects in both own funds and the calculation of the SCR or within the calculation of the SCR.

SCR.12.8. Undertakings should not in their use of risk mitigation techniques anticipate the shocks considered in the SCR calculation. The SCR is intended to capture unexpected risks.

SCR.12.9. The calculation should be made on the basis of assets and liabilities existing at the date of reference of the solvency assessment and the risk mitigating technique being in force for at least the next 12 months or in case it will be in force for a period shorter than 12 months it will be taken into account prorata temporis for the shorter of the full term of the risk exposure covered or the period that the risk mitigation technique is in force.

SCR.12.10. Where contractual arrangements governing the risk-mitigation techniques will be in force for a period shorter than the next 12 months and the insurance or reinsurance undertaking intends to replace that risk-mitigation technique at the time of its expiry with a similar arrangement, the risk-mitigation technique shall be fully taken into account in the Basic Solvency Capital Requirement provided the following qualitative criteria are met:

(a) the insurance or reinsurance undertaking has a written policy on the replacement of that risk-mitigation technique;

(b) the replacement of the risk-mitigation technique shall not take place more often than every three months;

(c) the replacement of the risk-mitigation technique is not conditional on any future event, which is outside of the control of the insurance or reinsurance undertaking. Where the replacement of the risk-mitigation technique is conditional on any future event, that is within the control of the insurance or reinsurance undertaking, then the conditions should be clearly documented in the written policy referred to in point (a);

(d) the replacement of the risk-mitigation technique shall be realistic based on replacements undertaken previously by the insurance or reinsurance undertaking and consistent with its current business practice and business strategy;

(e) the risk that the risk-mitigation technique cannot be replaced due to an absence of liquidity in the market is not material;

(f) the risk that the cost of replacing the risk-mitigation technique increases during the following 12 months is reflected in the Solvency Capital Requirement;

(g) the replacement of the risk-mitigation technique would not be contrary to requirements that apply to future management actions set out in section V.1.

SCR.12.11. Risk mitigation techniques not in place at the date of reference of the solvency assessment should not be allowed to reduce the calculation of the SCR with the standard formula.

SCR.12.12. The contractual arrangements governing the risk-mitigation technique shall ensure that the extent of the cover provided by the risk-mitigation technique and the transfer of risk is clearly defined and incontrovertible.

SCR.12.13. The contractual arrangement shall not result in material basis risk or in the creation of other risks, unless these are properly captured in the Basic Solvency Capital Requirement.

Basis risk is material if it leads to a misstatement of the risk-mitigating effect on the insurance or reinsurance undertaking's Basic Solvency Capital Requirement that could influence the decision-making or judgement of the intended user of that information, including the supervisory authorities.

SCR.12.14. The determination that the contractual arrangements and transfer of risk is legally effective and enforceable in all relevant jurisdictions shall be based on the following:

- (a) whether the contractual arrangement is subject to any condition which could undermine the effective transfer of risk, the fulfilment of which is outside the direct control of the insurance or reinsurance undertaking;
- (b) whether there are any connected transactions which could undermine the effective transfer of risk.

SCR.12.15. In addition, the following conditions must be met in order for insurance and reinsurance undertakings to take into account the insurance risk-mitigation technique in the Basic Solvency Capital Requirement:

SCR.12.16. In the case of reinsurance contracts the counterparty shall be:

- i. An insurance or reinsurance undertaking which complies with the Solvency Capital Requirement;
- ii. A third-country insurance or reinsurance undertaking, situated in a country whose solvency regime is deemed equivalent or temporarily equivalent to that laid down in Directive 2009/138/EC in accordance with Article 172 of Directive 2009/138/EC and which complies with the solvency requirements of that third-country; or
- iii. A third country insurance or reinsurance undertaking, which is not situated in a country whose solvency regime is deemed equivalent or temporarily equivalent to that laid down in Directive 2009/138/EC in accordance with Article 172 of Directive 2009/138/EC with a credit quality which has been assigned to credit quality step 3 or better in accordance with Subsections RECAI and UECAI.

SCR.12.17. Finite reinsurance, as defined in Article 210(3) of Directive 2009/138/EC, or similar arrangements, where the lack of effective risk transfer is comparable to that of finite reinsurance, that meet the requirements set out in this section, these contracts shall be recognised in the calculation of the Basic Solvency Capital Requirement only to the extent underwriting risk is transferred to the counterparty of the contract.

SCR.12.18. The allowance of insurance risk mitigation techniques is subject to the requirements in this subsection and the principles in Annex I being met.

SCR.12.3. Basis Risk

SCR.12.19. When an insurance risk mitigation technique includes basis risk (for example as might happen where payments are made according to external indicators rather than directly related to losses) the insurance risk mitigation instruments are only permissible in the calculation of the SCR with the standard formula if the undertaking can demonstrate that the basis risk is not material compared to the mitigation effect.

SCR.12.20. Basis risk is material if it leads to a misstatement of the risk-mitigating effect on the insurance or reinsurance undertaking's Basic Solvency Capital Requirement that could influence the decision-making or judgement of the intended user of that information, including the supervisory authorities.

SCR.12.21. Undertakings shall consider the risk-mitigation technique to have material basis risk where:

- a) The differences in behaviour resulting from the assessment have or may have an actual or potential material impact on the outcome of the risks of the undertaking covered by such arrangement, or
- b) The exposure covered by the financial risk-mitigation technique is expressed in a currency different from the risk exposure actually held by the undertaking, unless the currencies involved are pegged with a maximum variation of 5 per cent.

Material basis risk resulting from currency risk in insurance risk-mitigation techniques

SCR.12.22. In cases where insurance and reinsurance undertakings transfer underwriting risk using a reinsurance contract or special purpose vehicles which create additional currency risk, the insurance or reinsurance undertaking may take into account the risk mitigation effect arising from these insurance risk mitigation techniques in the calculation of the standard formula Solvency Capital Requirement, provided that this calculation is carried out in accordance SCR.12.23 and SCR.12.24.

SCR.12.23. Where there is any material currency risk stemming from the risk mitigation effects linked to the underwriting (sub)modules based on scenario calculations, and this currency risk is not already included in the Solvency Capital Requirement currency risk (sub)module, it shall be taken into account, for each foreign currency, in

the respective underwriting (sub)module at the most granular level of the standard formula application by adding to the capital requirement calculated according to the Section 2 a 25% difference between:

- a) the hypothetical capital requirement for underwriting risk (sub)module at the most granular level of the standard formula application that would apply if the risk of currency risk (sub)module would materialise with the standard shock;
- b) the capital requirement for underwriting risk (sub)module at the most granular level of the standard formula application.

SCR.12.24. Where the same insurance risk-mitigation technique with basis risk is used in several (sub)modules of the underwriting risk modules, the overall risk charge for basis risk in a reinsurance contract or special purpose vehicles (as a difference between the hypothetical solvency capital requirement that would apply if the risk of currency risk (sub)module would materialise with the standard shock and the overall solvency capital requirement) shall not exceed 25% of the capacity of the non-proportional reinsurance contract or special purpose vehicles arrangement. For the purpose of this implementing technical standard, the capacity of a non-proportional reinsurance contract or special purpose vehicles arrangement should be consistent with the maximum capacity which has been used within (sub)modules which are based on the impact of a scenario on the basic own funds of insurance and reinsurance undertakings for these insurance risk-mitigation techniques.

SCR.12.4. Credit quality of the counterparty

SCR.12.25. For the purposes of the Quantitative Assessment, providers of insurance risk mitigation should meet the following requirements:

- Reinsurance entities should meet their current capital requirements or have a credit quality step equal or equivalent to at least 3. 
- EEA SPVs that are currently authorised should meet the requirements set out in the national law of the Member States in which they are authorised
- Non-EEA SPVs should fully fund their exposure to the risks assumed from the undertaking through the proceeds of a debt issuance or other financing mechanism and the repayments rights of the providers of such debt or financing mechanism should be subordinated to the reinsurance obligations of the undertaking

SCR.12.26. The assessment of the above should be based on the latest available information, which should be no more than 12 months old.

SCR.12.27. Notwithstanding the above, to the extent that collateral, meeting the requirements in subsection SCR.11.8 has been provided, the risk mitigation technique should be recognised up to the amount of the collateral.

SCR.12.28. Risk mitigation may be used to mitigate the credit risk arising from reinsurance counterparties, subject to the requirements in subsection SCR.12 being met.

DRAFT

SCR.13. Simplifications applicable on ceding undertakings to captive reinsurers

SCR counterparty risk / recoverables towards a captive

SCR.13.1. If an explicit, legally effective and enforceable guarantee by the captive owner for the liabilities of the captive exists, then the credit quality step of the guarantor instead of the captive may be used

- in the calculation of the SCR counterparty default risk module for the ceding undertaking and
- in the calculation of the adjustment for expected losses due to counterparty default for the recoverables towards the captive.

Cut-through liability clauses

SCR.13.2. Captives' ceding undertakings may consider the probability of default of the retroceding undertakings of a captive if a legally effective and enforceable 'cut-through-liability' clause exists or a similar binding agreement, for the amounts involved in the transactions with the captive. These amounts can be adjusted accordingly in the counterparty default risk module calculation of the ceding undertaking.

SCR.14. Solo treatment of participations

SCR.14.1. Introduction

SCR.14.1 The intention of this section is to provide an overview of the treatment of related undertakings in each area of these technical specifications.

SCR.14.2. Once a participation has been identified in accordance with subsection SCR.14.2., the treatment of equity investments in that related undertaking, valued in accordance with subsection SCR.14.3., and of any other own-fund items, held in that related undertaking by the participating undertaking is provided in Annex V. The subsections SCR.14.4. to SCR.14.6. provide additional guidance.

SCR.14.2. Characteristics of a participation

SCR.14.3. A participation is constituted by share ownership or by the exertion of a dominant or significant influence over another undertaking. The following paragraphs describe how both types of participation can be identified.

SCR.14.4. The identification is based on an assessment from a solo perspective.

SCR.14.2.1 Participations by virtue of share ownership

SCR.14.5. When identifying a related undertaking based on share ownership, directly or by way of control, the participating undertaking should determine:

- a. its holding of voting rights as a percentage of an undertaking's voting rights; and
- b. its holding of all classes of share capital issued by an undertaking as a percentage of that undertaking's issued share capital, regardless of voting rights.

Where the participating undertaking's holding is 20 % or more, in either case its investment should be treated as a participation.

SCR.14.6. Where the participation is in an insurance or reinsurance undertaking subject to Solvency II, the assessments under SCR.14.5. a. will generally relate to paid-in ordinary share capital referred to in OF.4. (1) and under SCR.14.5. b. , to paid-in ordinary share capital referred to in OF.4. (1) and paid-in preference shares.

SCR.14.2.2 Participations by virtue of the exertion of dominant or significant influence

SCR.14.7. When identifying a related undertaking pursuant to Article 212 (2) of Directive 2009/138/EC on the basis that the participating undertaking can exert a dominant or significant influence over another undertaking, supervisory authorities should consider the following:

- a. current shareholdings and potential increases due to the holding of options, warrants or similar instruments;
- b. membership rights of a mutual or mutual-type undertaking and potential increases in such rights;
- c. representation on the administrative, management or supervisory board of the potential related undertaking;
- d. involvement in policy-making processes, including decision making about dividends or other distributions;
- e. material transactions between the participating undertaking and potential related undertaking;
- f. interchange of managerial personnel;
- g. provision of essential technical information;
- h. management on a unified basis.

Supervisory authorities should consider any initial assessment by the participating undertaking in accordance with points a. to h. of this paragraph.

SCR.14.2.3. Participations in financial and credit institutions

SCR.14.8.Undertakings should treat a related undertaking as a financial and credit institution, where it is an institution listed or described in accordance with Article 4 (1) and (5) of Directive 2006/48/EC or Article 4 (1) of Directive 2004/39/EC. These descriptions cover any institution which performs the functions or carries out the business described pursuant to those Articles, notwithstanding that the institution may not be subject to those Directives. The institution may not be subject to Directive 2006/48/EC or Directive 2004/39/EC, because it is a third country undertaking and thus out of scope of those Directives.

SCR.14.9. Any participation in a financial and credit institution where voting rights or capital in an undertaking are held indirectly is treated in the same way as a participation in a financial and credit institution where voting rights or capital are held directly.

SCR.14.2.4. Strategic participations

SCR.14.10.

1. Participating undertakings should identify strategic participations in accordance with SCR.14.2.4. as follows:
 - a. Participating undertakings using the standard formula to calculate their Solvency Capital Requirement should identify strategic participations regardless of whether their participation is in another insurance or reinsurance undertaking, in a financial and credit institution or in any other related undertaking.
 - b. Participating undertakings using an internal model to calculate their Solvency Capital Requirement need to identify strategic participations in financial and credit institutions for the purpose of assessing whether section SCR.14.4. applies. There are no other provisions that require participating undertakings using an internal model to apply SCR.14.2.4. for any other purpose.
2. An undertaking should comply with the demonstration requirements of SCR.14.2.4. in relation to the related undertaking as a whole. A participating undertaking should not divide a participation into different parts, treating some as strategic and others not. Once a particular participation has been identified as strategic:
 - a. In the case of a participation in a financial and credit institution, all investments in its own funds are strategic;
 - b. In the case of any other related undertaking, all equity investments in the participation are strategic.
3. In demonstrating that the value of the equity investment is likely to be materially less volatile, in accordance with SCR.14.2.4 (i), the participating undertaking should ensure that:
 - a. consistent and appropriate valuations are applied, in accordance with Article 75 (1) of Directive 2009/138/EC, both to the participation and to the other equities selected as a basis of comparison, recognising that different approaches may be required under Solvency II valuation principles depending upon the type of the investment;

- b. the choice of the measures for the value of other equities selected as a basis of comparison is appropriate and consistent over time;
 - c. it assesses the impact of its influence: 
 - i. where the participation is valued using the adjusted equity method in accordance with V.8., on factors affecting the excess of assets over liabilities which contribute to the valuation of its participation; or otherwise
 - ii. on the quoted market price of that related undertaking's shares and/or on other factors affecting that price.
4. In demonstrating that the nature of the investment is strategic, in accordance with SCR.14.2.4. (ii) (a) to (c)], the participating undertaking should:
- a. provide evidence of its adoption of a strategy of holding the participation, including any indication of the period for which such a strategy is intended to apply. Such evidence should consist of an undertaking's internal documentation, which should be consistent with externally communicated or relevant publically available information;
 - b. explain how this strategy is consistent with the main policies guiding or limiting the actions of the participating undertaking and the impact of market conditions on these. The explanation may draw on different sources including business plans, existing business models, contingency plans, management actions, including those identified for the purposes of Solvency II, and other relevant material; and
 - c. identify any significant factors or constraints on the participating undertaking's ability to maintain its strategy and how these could or would be mitigated.
5. In demonstrating the existence of a durable link, in accordance with SCR.14.2.4. (ii) (d)], the participating undertaking should consider:
- a. whether a stable relationship between the two undertakings exists over time;
 - b. whether that stable relationship results in a close economic bond or the sharing of risks and benefits between the undertakings;
 - c. whether the nature of this relationship between the two undertakings is such that it needs to be considered in order to understand the risks of the two undertakings; and
 - d. the form of the relationship, which might include ownership, joint products or distribution lines, cross-selling, creation of joint ventures together or other long term operational or financial links.

In considering these criteria, the participating undertaking should view them both together and separately in order to assess their significance in demonstrating a durable link.

6. In accordance with SCR.14.2.4. (ii) (e), a participating undertaking that is part of a group should provide evidence that its strategy to continue holding the participation for a long period is consistent with the main policies guiding or limiting the actions of the group as defined by the ultimate parent undertaking or, if different, the undertaking which sets the main policies for the group as a whole. The evidence may

be drawn from different sources including business plans, existing business models, contingency plans, management actions, including those identified for the purposes of Solvency II, and other relevant material.

The participating undertaking should document its consideration of the matters set out in SCR.14.2.4. and paragraphs 2 to 6 of this Guideline, including any other relevant factors, together with relevant supporting material and evidence.

SCR.14.3. Valuation

SCR.14.11. The valuation of participations for the purposes of the Quantitative Assessment is set out in V.8.

SCR.14.4. Treatment of participations, other than in financial and credit institutions, in the calculation of the Solvency Capital Requirement with the Standard Formula

SCR.14.12. The calculation of the Solvency Capital Requirement in accordance with the standard formula for participations in undertakings other than financial and credit institutions, does not require the aggregation of the investment in own funds items in respect of each participation. The equity risk charge relevant to the investment in ordinary or preference share capital of the related undertakings is determined independently from the application of the relevant risk charges (e.g. interest, spread, concentration, currency) to any investment in subordinated liabilities of the related undertaking, which is treated as a bond.

SCR.14.13. When applying the standard formula to the equity and subordinated liability components of a participation, the undertaking has to:

- (i) apply the interest and spread risk sub-modules set out in subsection SCR.5.5. and SCR.5.9. relevant to bonds to holdings of subordinated liabilities
- (ii) apply the relevant equity risk charges to equity holdings as set out in subsection SCR.5.6.
- (iii) apply additional market risk sub-modules, such as currency, as appropriate.

SCR.14.5. Treatment of participations in financial and credit institutions in the calculation of Own Funds

SCR.14.14. When calculating the value of a participation, in order to assess whether the deductions set out in SCR.14.16. or SCR.14.17. apply, the undertaking has to consider holdings of both equity and any other own-fund items held in the related undertaking by the participating undertaking.

SCR.14.15. The deductions and other treatments in respect of financial and credit institutions are set out in Annex V.

SCR.14.16. The basic own funds have to be reduced by the full value of each participation in a financial and credit institution that exceeds 10% of items listed in OF.3. (1) (a), (b), (d), (f).

SCR.14.17. The basic own funds have to be reduced by the part of the aggregate value of all participations in financial and credit institutions, other than participations dealt with under SCR.14.16., that exceeds 10% of items listed in points OF.3. (1) (a), (b), (d), (f).

SCR.14.18. In calculating the 10% of items listed in OF.3. (1) (a), (b), (d), (f) the amount of own-funds items before any deduction set out in SCR.14.16. or SCR.14.17. is used.

SCR.14.19. Notwithstanding SCR.14.16. and SCR.14.17., there is no deduction for strategic participations which are included in the calculation of the group solvency on the basis of method 1 as described in subsection G.1.1.

SCR.14.20. Deductions according to SCR.14.17. are applied on a pro-rata basis to all participations referred to in that paragraph.

SCR.14.21. Deductions included in paragraphs SCR.14.16. and SCR.14.17. are made from the corresponding tier in which the participation has increased the own funds of the related undertaking as follows:

(i) holdings of Common Equity Tier 1 items of financial and credit institutions have to be deducted from the items listed in OF.3. (1) (a), (b), (d), (f).

(ii) holdings of Additional Tier 1 instruments of financial and credit institutions have to be deducted from the items listed in OF.3. (1) (c), (e), (2).

(iii) holdings of Tier 2 instruments of financial and credit institutions have to be deducted from the items listed in OF.18.

SCR.14.22. Where the items to be deducted are not classified into tiers, all deductions are made from the amount of items listed in OF.3. (1) (a), (b), (d), (f).

SCR.14.23. Where the amount of the deduction exceeds the amount from which it is required to be deducted in accordance with SCR.14.21., the excess is deducted from higher quality items until the deduction is made in full.

SCR.14.24. In the calculation of the Solvency Capital Requirements amounts not deducted should be treated in accordance with subsection 14.6. when an internal model is used and section SCR.5. when the standard formula is applied.

SCR.14.6. Treatment of participations in the calculation of the Solvency Capital Requirement with an internal model

SCR.14.25. The requirements set out in subsection SCR.14.5. apply to firms using internal models in so far as any reduction of own funds set out in subsection SCR.14.5. for holdings in financial and credit institutions has to be made. The treatment of holdings in financial and credit institutions not deducted in whole or part has to ensure that the requirements set out in Article 103 (3) of Directive 2009/138/EC are met.

DRAFT

SECTION 3 – Minimum Capital Requirement

MCR.1. Introduction

MCR.1 This section provides instructions for calculating the Minimum Capital Requirement (MCR) of the undertaking. The calculation of the MCR combines a linear formula with a floor of 25% and a cap of 45% of the SCR (whether calculated using the standard formula or an internal model). The MCR is subject to an absolute floor, expressed in euros, depending on the nature of the undertaking.

MCR.2 For composite undertakings, the notional non-life and life MCR are also calculated.

MCR.2. Overall MCR calculation

Input

MCR.3 The following input information is required:

MCR_{NL}	=	the linear formula component for non-life insurance or reinsurance obligations
MCR_L	=	the linear formula component for life insurance or reinsurance obligations
SCR	=	the SCR of the undertaking
$AMCR$	=	the absolute floor of the MCR, as defined in in a draft of the Omnibus II directive, and clarified further in MCR.6.

MCR.4 The segmentation approach for the purposes of determining the linear formula components for life and non-life insurance and reinsurance obligations should follow the same approach as that set out in subsection V.2.1 (Segmentation). Health insurance obligations should therefore be split into health insurance or reinsurance obligations which are pursued on a similar technical to that of life insurance and health insurance or reinsurance obligations which are not pursued on a similar technical basis to that of life insurance.

MCR.5 For the purpose of the Quantitative Assessment, the capital add-on, which is required (if relevant) to be included in the calculation of the MCR corridor, is considered to be zero for all undertakings.

MCR.6 The values of the absolute floor $AMCR$ are:

- (i) EUR 2 500 000 for non-life insurance undertakings, including captive insurance undertakings, save in the case where all or some of the risks included

in one of the classes 10 to 15 listed in Part A of Annex K²⁹ are covered, in which case it should be no less than EUR 3 700 000,

- (ii) EUR 3 700 000 for life insurance undertakings, including captive insurance undertakings,
- (iii) EUR 3 600 000 for reinsurance undertakings, except in the case of captive reinsurance undertakings, in which case the Minimum Capital Requirement should be no less than EUR 1 200 000,
- (iv) the sum of the amounts set out in points (i) and (ii) for insurance undertakings as referred to in Article 73(5) of the Solvency II Framework Directive (Directive 2009/138/EC also known as “old composite” undertakings).
- (v) the sum of amounts set out in points (i) and (ii) for insurance undertakings as referred to in Article 73(2) of the Solvency II Framework Directive (Directive 2009/138/EC also known as “new composite” undertakings).

Output

MCR.7 The calculation delivers the following output:

MCR the Minimum Capital Requirement of the undertaking

MCR.8 The following intermediate outputs are also calculated:

MCR_{linear} = the linear formula, whose calculation is further detailed below.

MCR_{combined} = the combined MCR of the undertaking, i.e. the linear formula result subject to a floor of 25% and a cap of 45% of the SCR (without taking into account the absolute floor)

Calculation

MCR.9 The linear Minimum Capital Requirement shall be equal to the following:

$$MCR_{linear} = MCR_{(linear,nl)} + MCR_{(linear,l)}$$

Where:

- (a) *MCR_(Linear,nl)* denotes the linear formula component for non-life insurance and reinsurance obligations;
- (b) *MCR_(Linear,l)* denotes the linear formula component for life insurance and reinsurance obligations.

MCR.10 The combined MCR of the undertaking is calculated as follows:

$$MCR_{combined} = \min(\max(0.25 \cdot SCR, MCR_{linear}), 0.45 \cdot SCR)$$

MCR.11 The MCR of the undertaking should be calculated as follows:

²⁹ Motor vehicle liability; Aircraft liability; Liability for ships (sea, lake and river and canal vessels); General liability; Credit; Suretyship

$$MCR = \max \{MCR_{combined}; AMCR\}$$

MCR.3. Linear formula component for non-life insurance or reinsurance obligations

Input

MCR.12 The linear formula component for non-life insurance and reinsurance obligations shall be equal to the following:

$$MCR_{(linear,nl)} = \sum_s (\alpha_s \cdot TP_{(nl,s)} + \beta_s \cdot P_s)$$

Where:

- (a) the sum covers all segments set out in the table below;
- (b) $TP_{(nl,s)}$ denotes the technical provisions without a risk margin for non-life insurance and reinsurance obligations in the segment s after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, with a floor equal to zero;
- (c) P_s denotes the premiums written for insurance and reinsurance obligations in the segment s during the last 12 months, after deduction of premiums for reinsurance contracts, with a floor equal to zero.

The segmentation of lines of business for the above formula and the calibration of the factors α_j and β_j is the following:

j	Line of business	α_j	β_j
A.1	Medical expense insurance and proportional reinsurance	[4,7] %	[4,7] %
A.2	Income protection insurance and proportional reinsurance	[13,1] %	[8,5] %
A.3	Workers' compensation insurance and proportional reinsurance	[10,7] %	[7,5] %
A.4	Motor vehicle liability insurance and proportional reinsurance	[8,5] %	[9,4] %
A.5	Other motor insurance and proportional reinsurance	[7,5] %	[7,5] %
A.6	Marine, aviation and transport insurance and proportional	[10,3] %	[14] %

reinsurance			
A.7	Fire and other damage to property insurance and proportional reinsurance	[9,4] %	[7,5] %
A.8	General liability insurance and proportional reinsurance	[10,3] %	[13,1] %
A.9	Credit and suretyship insurance and proportional reinsurance	[17,7] %	[11,3] %
A.10	Legal expenses insurance and proportional reinsurance	[11,3] %	[6,6] %
A.11	Assistance and its proportional reinsurance	[18,6] %	[8,5] %
A.12	Miscellaneous financial loss insurance and proportional reinsurance	[18,6] %	[12,2] %
A.13	Non-proportional casualty reinsurance	[18,6] %	[15,9] %
A.14	Non-proportional marine, aviation and transport reinsurance	[18,6] %	[15,9] %
A.15	Non-proportional property reinsurance	[18,6] %	[15,9] %
A.16	Non-proportional health reinsurance	[18,6] %	[15,9] %

MCR.4. Linear formula component for life insurance or reinsurance obligations

Input

$TP_{(life,1)}$ the technical provisions without a risk margin in relation to guaranteed benefits for life insurance obligations with profit participation, after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, with a floor equal to zero, and technical provisions without a risk margin for reinsurance obligations where the underlying life insurance obligations include profit participation, after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, with a floor equal to zero;

$TP_{(life,2)}$ the technical provisions without a risk margin in relation to future discretionary benefits for life insurance obligations with profit participation, after deduction of the amounts recoverable from reinsurance contracts and

special purpose vehicles, with a floor equal to zero;

$TP_{(life,3)}$ the technical provisions without a risk margin for index-linked and unit-linked life insurance obligations and reinsurance obligations relating to such insurance obligations, after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, with a floor equal to zero;

$TP_{(life,4)}$ the technical provisions without a risk margin for all other life insurance and reinsurance obligations, after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles, with a floor equal to zero;

CAR the total capital at risk, being the sum, in relation to each contract that give rise to life insurance or reinsurance obligations, of the capital at risk of the contracts.

Output

MCR.13 The calculation delivers the following output:

MCR_L = the linear formula component for life insurance or reinsurance obligations

Calculation

The linear formula component MCR_L for life insurance or reinsurance obligations is calculated by the following function:

$$MCR_{linear,l} = [0.037].TP_{(life,1)} - [0.052].TP_{(life,2)} + [0.0007].TP_{(life,3)} + [0.021].TP_{(life,4)} + [0.007].CAR$$

MCR.14 Technical provisions after deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles referred to in points (a) to (d) of paragraph MCR. 21, shall be taken to include the following amounts:

- (a) amounts recoverable from reinsurance contracts or special purpose vehicles that cannot be taken into account in accordance with paragraphs 4 and 6 of Article TP22;
- (b) amounts recoverable from reinsurance contracts or special purpose vehicles that do not meet the requirements set out in Articles SCRRM1 to SCRRM7 or TSIM14.

MCR.5. Linear formula component for composite insurance undertakings

MCR.15 The notional life Minimum Capital Requirement and the notional non-life Minimum Capital Requirement as referred to in Article 74(2) of Directive 2009/138/EC shall be calculated in accordance with the approach set out in MCR.20 to MCR.35.

MCR.16 The notional non-life Minimum Capital Requirement shall be equal to the following: $NMCR_{nl} = \max(NMCR_{(combined,nl)}; AMCR_{nl})$

where:

- (a) $NMCR_{(combined,nl)}$ denotes the notional combined non-life Minimum Capital Requirement;
- (b) $AMCR_{nl}$ denotes the absolute floor prescribed in Article 129(1)(d)(i) of Directive 2009/138/EC and in Article MCR7.

MCR.17 The notional combined non-life Minimum Capital Requirement shall be equal to the following:

$$NMCR_{(combined,nl)} = \min(\max(NMCR_{(linear,nl)}; 0.25 \cdot (NSCR_{nl} + Addon_{nl})); 0.45 \cdot (NSCR_{nl} + Addon_{nl}))$$

where:

- (a) $NMCR_{(linear,nl)}$ denotes the notional linear Minimum Capital Requirement for non-life insurance or reinsurance activity;
- (b) $NSCR_{nl}$ denotes the notional Solvency Capital Requirement for non-life insurance or reinsurance activity;
- (c) $Addon_{nl}$ denotes the part of the capital add-ons, set by the supervisory authority in accordance with Article 37 of Directive 2009/138/EC, which has been apportioned by that supervisory authority to the non-life insurance or reinsurance activity of the insurance or reinsurance undertaking;

MCR.18 The notional linear Minimum Capital Requirement for non-life insurance or reinsurance activity shall be equal to the following:

$$NMCR_{(linear,nl)} = MCR_{(nl,nl)} + MCR_{(l,nl)}$$

where:

- (a) $MCR_{(nl,nl)}$ denotes the linear formula component for non-life insurance and reinsurance obligations relating to non-life insurance or reinsurance activity;
- (b) $MCR_{(l,nl)}$ denotes the linear formula component for life insurance and reinsurance obligations relating to non-life insurance or reinsurance activity.

MCR.19 $MCR_{(nl,nl)}$ and $MCR_{(l,nl)}$ shall be calculated in the same way as $MCR_{(linear,nl)}$ and $MCR_{(linear,l)}$ as referred to in Article MCR2, respectively, but the technical provisions

or premiums written used in the calculation shall only relate to the insurance and reinsurance obligations of non-life insurance or reinsurance activity in accordance with Annex H of Directive 2009/138/EC.

MCR.20 The notional Solvency Capital Requirement for non-life insurance or reinsurance activity shall be equal to the following:

$$NSCR_{nl} = \frac{NMCR_{(linear,nl)}}{NMCR_{(linear,nl)} + NMCR_{(linear,l)}} \cdot SCR$$

where:

- (a) *SCR* denotes the Solvency Capital Requirement calculated in accordance with Chapter VI, Section 4, Subsections 2 or 3 of Directive 2009/138/EC, which shall for the purpose of this Article exclude any capital add-on imposed in accordance with Article 37 of Directive 2009/138/EC;
- (b) $NMCR_{(linear,nl)}$ denotes the notional linear non-life Minimum Capital Requirement for non-life insurance or reinsurance activity;
- (c) $NMCR_{(linear,l)}$ denotes the notional linear Minimum Capital Requirement for life insurance or reinsurance activity.

MCR.21 The notional life Minimum Capital Requirement shall be equal to the following:

$$NMCR_l = \max(NMCR_{(combined,l)}; AMCR_l)$$

where:

- (a) $NMCR_{(combined,l)}$ denotes the notional combined life Minimum Capital Requirement;
- (b) $AMCR_l$ denotes the absolute floor prescribed in Article 129(1)(d)(ii) of Directive 2009/138/EC.

MCR.22 The notional combined life Minimum Capital Requirement shall be equal to the following:

$$NMCR_{(combined,l)} = \min(\max(NMCR_{(linear,l)}; 0.25 \cdot (NSCR_l + Addon_l)); 0.45 \cdot (NSCR_l + Addon_l))$$

where:

- (a) $NMCR_{(linear,l)}$ denotes the notional linear Minimum Capital Requirement for life insurance or reinsurance activity;
- (b) $NSCR_l$ denotes the notional Solvency Capital Requirement for life insurance or reinsurance activity;
- (c) $Addon_l$ denotes the part of the capital add-ons, set by the supervisory authority in accordance with Article 37 of Directive 2009/138/EC, which has been

apportioned by that supervisory authority to the life insurance or reinsurance activity of the insurance or reinsurance undertaking.

MCR.23 The notional linear Minimum Capital Requirement for life insurance or reinsurance activity shall be equal to the following:

$$NMCR_{(linear,l)} = MCR_{(nl,l)} + MCR_{(l,l)}$$

where:

- (a) $MCR_{(nl,l)}$ denotes the linear formula component for non-life insurance and reinsurance obligations relating to life insurance or reinsurance activity;
- (b) $MCR_{(l,l)}$ denotes the linear formula component for life insurance and reinsurance obligations relating to life insurance or reinsurance activity.

MCR.24 $MCR_{(nl,l)}$ and $MCR_{(l,l)}$ shall be calculated in the same way as $MCR_{(linear,nl)}$ and $MCR_{(linear,l)}$ as referred to in Article MCR2, respectively, but the technical provisions or premiums written used in the calculation shall only relate to the insurance and reinsurance obligations of life insurance or reinsurance activity in accordance with Annex HI of Directive 2009/138/EC.

MCR.25 The notional Solvency Capital Requirement for life insurance or reinsurance activity shall be equal to the following:

$$NSCR_t = \frac{NMCR_{(linear,l)}}{NMCR_{(linear,nl)} + NMCR_{(linear,l)}} \cdot SCR$$

where:

- (a) SCR denotes the Solvency Capital Requirement calculated in accordance with Chapter VI, Section 4, Subsections 2 or 3 of Directive 2009/138/EC, which shall for the purpose of this Article exclude any capital add-on imposed in accordance with Article 37 of Directive 2009/138/EC;
- (b) $NMCR_{(linear,nl)}$ denotes the notional linear non-life Minimum Capital Requirement for non-life insurance or reinsurance activity;
- (c) $NMCR_{(linear,l)}$ denotes the notional linear Minimum Capital Requirement for life insurance or reinsurance activity.

SECTION 4 – OWN FUNDS

OF.1. Introduction

OF.1. This section provides specifications for the classification and eligibility of own funds

The Quantitative Assessment will operate on the basis of applying Solvency II to all existing items of own funds. Full criteria are specified for all three tiers. In addition to that, transitional provisions are included at the end of this section. According to these provisions, items that are currently eligible as own funds could be treated as own funds under Solvency II for the purposes of this assessment. However, if existing items already fulfill the criteria of Tier 1, Tier 2 or Tier 3 items as laid down on the following pages, they will not qualify for the transitional provisions, but would need to be classified to Tier 1, Tier 2 or Tier 3 directly. This will mostly be the case for Tier 1 Unrestricted items as listed in OF.3, but there might be also hybrid capital that already fulfills e.g. the Tier 2 criteria and would thus not require any transitional treatment.

Definitions:

‘Alternative coupon satisfaction mechanism (ACSM)’ means a term in the contractual arrangements governing an own-fund item that negates the obligation to pay a distribution in cash by issuing ordinary share capital to the holder of the own-fund item instead.

‘Instrument’ means a security relating to an own-fund item.

‘Principal stock settlement’ means a term in the contractual arrangements governing an own-fund item that requires the holder of the own-fund item to receive ordinary shares in the event that a call is not exercised.

‘Repayment or redemption’ means the repurchase or buyback of any own-fund item or any other arrangement that has the same economic effect. This includes share buybacks, tender operations, repurchase plans and repayment of principal at maturity for dated items as well as repayment or redemption following the exercise of an issuer call option.

‘Retained earnings’ means the portion of net income which is retained by an undertaking that is not immediately distributed to shareholders as dividends.

‘Share premium account’ means a separate account or reserve to which share premiums are transferred in accordance with national legislation.

‘Share premium’ means the amount between the value received at issuance and the nominal value of the share at issuance.

‘Step-up’ means a term in the contractual arrangements governing an own-fund item that leads to distributions on the item being increased after a specified date or event.

OF.2. Classification of own funds into tiers and list of capital items

The following paragraphs set out the potential own funds items considered for Quantitative Assessment purposes and the criteria for classification.

OF.2.1. Tier 1 Basic Own Funds

OF.2. Basic own-fund items shall be classified in Tier 1 where they are listed in OF.3 and display the features set out in OF.9.

List of own-funds items

OF.3. The following basic own-fund items shall be classified in Tier 1, where those items display the features set out in OF.9:

- (1) the part of the excess of assets over liabilities, valued in accordance with Article 75 and Section 2 of Chapter VI of Directive 2009/138/EC, comprising the following items:
 - (a) paid-in ordinary share capital and the related share premium account;
 - (b) paid-in initial funds, members' contributions or the equivalent basic own-fund item for mutual and mutual-type undertakings;
 - (c) paid-in subordinated mutual member accounts;
 - (d) surplus funds that are not considered insurance and reinsurance liabilities in accordance with Article 91 (2) of Directive 2009/138/EC;
 - (e) paid-in preference shares and the related share premium account;
 - (f) a reconciliation reserve;
- (2) paid-in subordinated liabilities valued in accordance with Article 75 of Directive 2009/138/EC.

Paid-in ordinary share capital

OF.4.

- (1) For the purposes of OF.3 (1) (a), paid-in ordinary share capital shall be identified by the following properties:

- (a) The shares are issued directly by the undertaking with the prior approval of its shareholders or, where permitted under national law, its management body, and
 - (b) The shares entitle the owner to claim on the residual assets of the insurance or reinsurance undertaking in the event of its winding-up. The claim shall be proportionate to the amount of such items issued, not fixed, nor subject to a cap.
- (2) Where an undertaking describes more than one class of share as ordinary share capital:
- (i) The criteria for classification as ordinary share capital are applied to each class separately.
 - (ii) A class of ordinary shares is only classified as ordinary share capital provided that it meets all relevant criteria, in particular those specified in OF.9.
 - (iii) Differences between classes which provide for one class to rank ahead of another or which create any preference as to distributions have to be identified and only the class which ranks after all other claims and has no preferential rights is classified as ordinary share capital.
 - (iv) Classes ranking ahead of the most subordinated class or which have other preferential features which do not satisfy the criteria for ordinary share capital are classified as preference shares provided they meet all relevant criteria for that item.

Reconciliation reserve

OF.5.

The reconciliation reserve referred to in point OF.3 (1) (f) equals the total excess of assets over liabilities reduced by:

- (a) the amount of own shares held by the insurance and reinsurance undertaking;
- (b) any foreseeable dividends, distributions and charges;
- (c) the basic own-fund items included in points (a) to (e) of OF.3 (1), OF.18 (1) and OF.25 (1);
- (d) the restricted own-fund items that exceed the notional Solvency Capital Requirement in the case of ring-fenced funds determined in accordance with SCR.10.33.;
- (e) the amount of participations held in financial and credit institutions as referred to in Article 92(2) of Directive 2009/138/EC deducted in accordance with SCR.14.4 to the extent that this is not already included in points (a) to (e).

OF.6. The excess of assets over liabilities referred to in OF.5 includes the amount that corresponds to the expected profit included in future premiums.

OF.7. The determination of whether, and to what extent, the reconciliation reserve displays the features set out in section OF.9 shall not assess the features of the assets and liabilities that are included in computing the excess of assets over liabilities or the underlying items in the undertakings' financial statements.

Own shares and foreseeable dividends

OF.8.

- (1) For the purposes of OF.5 (1) (a), own shares held by the undertaking shall include direct and indirect holdings.
- (2) For the purposes OF.5 (1) (b), foreseeable dividends and distributions shall fulfil the following criteria:
 - (a) A dividend or distribution shall be foreseeable at the latest when it is declared or approved by the administrative, management or supervisory body of the insurance or reinsurance undertaking and the other persons who effectively run the undertaking, regardless of any requirement for formal approval at the annual general meeting;
 - (b) Where a participating undertaking holds a participation in another undertaking which has a foreseeable dividend, the participating undertaking shall make no reduction to its reconciliation reserve for that foreseeable dividend.

Features determining classification

OF.9.

The basic own-fund items listed in OF.3 shall display the following features in order to be classified in Tier 1.

The own-fund items listed in OF.3 (1) (a), (b), (d) shall be assessed against the following features. The other items listed in OF.3 may fall under the transitional provisions as set out in section 4 (OF.40 and OF.41).

Subordination

- (a) the basic own-fund item:
 - (i) in the case of items referred to in points (a) and (b) of Article OF.3(1), ranks after all other claims in the event of winding-up proceedings regarding the insurance or reinsurance undertaking;
 - (ii) in the case of items referred to in points (1) (c), (e) and (2) of Article OF.3, ranks to the same degree as, or ahead of, the items referred to in points (a) and (b) of Article OF.3(1), but after items listed in OF.18 and OF.25 that display the features set out in OF.20 and OF.26 respectively and after the claims of all policy holders and beneficiaries and non-subordinated creditors;

Absence of features causing or accelerating insolvency

- (b) the basic own-fund item does not include features which may cause the insolvency of the insurance or reinsurance undertaking or may accelerate the process of the undertaking becoming insolvent;

In the case of an item referred to in OF.3(1) (a), (b) and (d) features which may cause the insolvency of the insurance or reinsurance undertaking or accelerate the process of the undertaking becoming insolvent include:

- The holder of the security relating to an own-fund item is in a position to petition for the insolvency of the issuer in the event of distributions not being made;
- The item is treated as a liability where a determination that the liabilities of an undertaking exceed its assets constitutes a test of insolvency under applicable national law;

- The holder of the security relating to an own-fund item may, as a result of a distribution being cancelled, be granted the ability to cause full or partial payment of the amount invested, or to demand penalties or any other compensation that could result in a decrease of own funds.

In the case of an item referred to in OF.3 (1) (c), (1) (e) and (2), features which may cause the insolvency of the insurance or reinsurance undertaking or accelerate the process of the undertaking becoming insolvent include:

- The holder of the security relating to an own-fund item is in a position to petition for the insolvency of the issuer in the event of distributions not being made;
- The item is treated as a liability where a determination that the liabilities of an undertaking exceed its assets constitutes a test of insolvency under applicable national law;
- The terms of the contractual arrangement governing the own-fund item could prevent the undertaking from continuing to do business as a going concern in the best interests of the policyholders, other beneficiaries and senior creditors in priority to the interests of the holders of the security, by specifying circumstances or conditions which if met would require the initiation of insolvency or any other procedure which would prejudice the continuance of the undertaking or its business as a going concern;
- The holder of the security relating to an own-fund item may, as a result of a distribution being cancelled, be granted the ability to cause full or partial payment of the amount invested, or to demand penalties or any other compensation that could result in a decrease of own funds.

Immediate availability to absorb losses

- (c) the basic own-fund item is immediately available to absorb losses;
- (d) the basic own-fund item absorbs losses at least once there is non-compliance with the Solvency Capital Requirement and does not hinder the recapitalisation of the insurance or reinsurance undertaking;

The own-fund item is immediately available to absorb losses, if

- (i) The terms of the contractual arrangement governing the own-fund item do not include any terms which prevent or act as a disincentive to new own funds being raised.
- (ii) The terms of the contractual arrangement do not require that any own funds arising from a new or increased own-fund item improve or maintain the position of existing holders of an original item;
- (iii) The terms of the contractual arrangement governing the own-fund item do not include terms that prevent distributions on other own-fund items;
- (iv) The terms of the item, or any connected arrangement, do not provide that:
 - o any new own funds items raised by the undertaking are junior to that item in conditions of stress or other circumstances where additional own funds may be needed, or
 - o the item is subject to an automatic conversion into a more senior item in terms of subordination, in conditions of stress, other circumstances

where own funds may be needed or structural change including a merger or acquisition.

Principal loss absorbency

(d)bis the basic own-fund item, in the case of items referred to in points (1)(c), (e) and (2) of OF.3, possesses one of the following principal loss absorbency mechanisms to be triggered at the trigger event specified in OF.12:

- (i) the nominal or principal amount of the basic own-fund item is written down as set out below;
- (ii) the basic own-fund item automatically converts into a basic own-fund item listed in points (a) or (b) of OF.3 (1) as set out below; or
- (iii) a principal loss absorbency mechanism that achieves an equivalent outcome to the principal loss absorbency mechanisms set out in points (i) or (ii);

For the purposes of (i), the nominal or principal amount of the basic own-fund item shall be written down in such a way that all of the following are reduced:

- the claim of the holder of that item in the event of winding-up proceedings;
- the amount required to be paid on repayment or redemption of that item;
- the distributions paid on that item.

For the purposes of (ii), the provisions governing the conversion to the basic own-fund item listed in points (a) or (b) of OF.3 (1) shall specify either of the following:

- the rate of conversion and a limit on the permitted amount of conversion;
- a range within which the instruments will convert into the basic own funds item listed in points (a) or (b) of OF.3 (1).

Duration

- (e) the basic own-fund item:
 - (i) in the case of items referred to in points (a) and (b) of OF.3 (1), is undated or, where the insurance or reinsurance undertaking has a fixed maturity, is of the same maturity as the undertaking;
 - (ii) in the case of items referred to in points (1) (c), (e) and (2) of OF.3, is undated; the first contractual opportunity to repay or redeem the basic own-fund item does not occur before 5 years from the date of issuance;

For the purposes of (ii): The item does not include a contractual term providing for a call option prior to 5 years from the date of issuance, including call options predicated on unforeseen changes, outside the control of the undertaking, related to the treatment of an own fund item. Subject to all relevant criteria being met and to prior supervisory approval, arrangements predicated on unforeseen changes, which are outside the control of the undertaking, that would give rise to transactions or arrangements which are not deemed to be repayment or redemption shall be permitted.

Repayment or redemption and absence of incentives to redeem

- (e)bis a basic own-fund item referred to in points (1) (c), (e) and (2) of OF.3 may only allow for repayment or redemption of that item between 5 and 10 years after the date of

issuance where the undertaking's Solvency Capital Requirement is exceeded by an appropriate margin taking into account the solvency position of the undertaking including the undertaking's medium-term capital management plan.

- (f) the basic own-fund item, in the case of items referred to in points (1) (a), (b), (c), (e) and (2) of OF.3, is only repayable or redeemable at the option of the insurance or reinsurance undertaking and the repayment or redemption of the basic own-fund item is subject to prior supervisory approval;

For this purpose:

- (i) The terms of the item or any associated arrangement do not provide for any incentive to redeem as set out in section OF.31.
- (ii) Redemption is permissible at the discretion of the undertaking, but the undertaking does nothing to create an expectation at issuance that the item will be redeemed or cancelled nor do the contractual terms governing the own-fund item contain any term which might give rise to such an expectation, other than the inclusion of a contractual maturity, for a dated instrument, which is itself suspended on non-compliance with the Solvency Capital Requirement.
- (iii) The item shall be treated as repaid or redeemed with effect from the date of notice to holders of the item or the date of supervisory approval, if no notice is required, and shall be excluded from own funds as at that date.

- (f)bis the basic own-fund item, in the case of items referred to in points (1) (a), (b), (c), (e) and (2) of OF.3, does not include any incentives to repay or redeem that item that increase the likelihood that an insurance or reinsurance undertaking will repay or redeem that basic own-fund item where it has the option to do so;

Suspension of repayment or redemption in case of non-compliance with the SCR

- (g) the basic own-fund item, in the case of items referred to in points (1) (a), (b), (c), (e) and (2) of OF.3, provides for the suspension of repayment or redemption of that item in the event that there is non-compliance with the Solvency Capital Requirement or repayment or redemption would lead to such non-compliance until the undertaking complies with the Solvency Capital Requirement and the repayment or redemption would not lead to non-compliance with the Solvency Capital Requirement;

- (g)bis notwithstanding point (g), the basic own-fund item may only allow for repayment or redemption of that item in the event that there is non-compliance with the Solvency Capital Requirement or repayment or redemption would lead to such non-compliance, where the following conditions are met:

- (i) the supervisory authority has exceptionally waived the suspension of repayment or redemption of that item;
- (ii) the item is exchanged for or converted into another Tier 1 own-fund item of at least the same quality;
- (iii) the Minimum Capital Requirement is complied with after the repayment or redemption.

Cancellation of distributions in case of non-compliance with the SCR

- (h) the basic own-fund item:

- (i) in the case of items referred to in points (1) (a) and (b) of OF.3, either the legal or contractual arrangements governing the item or national legislation allow for the distributions in relation to that item to be cancelled in the event that there is non-compliance with the Solvency Capital Requirement or the distribution would lead to such non-compliance until the undertaking complies with the Solvency Capital Requirement and the distribution would not lead to non-compliance with the Solvency Capital Requirement;
 - (ii) in the case of items referred to in points (1) (c), (e) and (2) of OF.3 the terms of the contractual arrangement governing the own-fund item provide for the cancellation of distributions in relation to that item in the event that there is non-compliance with the Solvency Capital Requirement or the distribution would lead to such non-compliance until the undertaking complies with the Solvency Capital Requirement and the distribution would not lead to non-compliance with the Solvency Capital Requirement;
- (h)bis notwithstanding point (h), the basic own-fund item may only allow for a distribution to be made in the event that there is non-compliance with the Solvency Capital Requirement or the distribution on a basic-own-fund item would lead to such non-compliance, where the following conditions are met:
- (i) the supervisory authority has exceptionally waived the cancellation of distributions;
 - (ii) the distribution does not further weaken the solvency position of the insurance or reinsurance undertaking;
 - (iii) the Minimum Capital Requirement is complied with after the distribution is made.

For this purpose:

- an alternative coupon satisfaction mechanism may only be included in the terms of the contractual arrangement governing the own-fund item where the mechanism provides for distributions to be settled through the issue of ordinary share capital;
- an alternative coupon satisfaction mechanism may only be included if it achieves the same economic result as the cancellation of the distribution and there is no decrease in own funds;
- any distributions under the alternative coupon satisfaction mechanism must occur as soon as permitted using unissued ordinary share capital which has already been approved or authorised under national law or under the statutes of the undertaking;
- the alternative coupon satisfaction mechanism may not use own shares held as a result of repurchase; and
- the terms of the contractual arrangement governing the own-fund item:

- provide for the operation of any alternative coupon satisfaction mechanism to be subject to an exceptional waiver from the supervisory authority under (h)bis (i) of this section on each occasion that coupon cancellation is required;
- state that the waiver is intended to operate on an exceptional basis, and
- do not oblige the undertaking to operate the alternative coupon satisfaction mechanism.

Full discretion over distributions

- (i) notwithstanding point (h), the basic own-fund item, in the case of items referred to in points (1) (a), (b), (c), (e) and (2) of OF.3, provides the insurance or reinsurance undertaking with full flexibility over the distributions on the basic own-fund item;

Full flexibility over the distributions, in the case of basic own-fund items referred to in points (1) (a) and (b) of OF.3, shall mean that:

- (i) there is no preferential distribution treatment regarding the order of distribution payments and the terms of the contractual arrangement governing the own-fund item do not provide preferential rights to the payment of distributions;
- (ii) distributions are paid out of distributable items;
- (iii) the level of distributions is not determined on the basis of the amount for which the own-fund item was purchased at issuance and there is no cap or other restriction on the maximum level of distribution;
- (iv) there is no obligation for an insurance or reinsurance undertaking to make distributions;
- (v) non-payment of distributions does not constitute an event of default of the insurance or reinsurance undertaking;
- (vi) the cancellation of distributions imposes no restrictions on insurance or reinsurance undertaking.

Full flexibility over the distributions, in the case of basic own-fund items referred to in points (1) (c), (e) and (2) of OF.3, shall mean that:

- (i) distributions are paid out of distributable items;
- (ii) insurance and reinsurance undertakings have full discretion at all times to cancel distributions in relation to the own-fund item for an unlimited period and on a non-cumulative basis and the institution may use the cancelled payments without restriction to meet its obligations as they fall due;
- (iii) there is no obligation to substitute the distribution by a payment in any other form;
- (iv) there is no obligation to make distributions in the event of a distribution being made on another own-fund item;

- (v) non payment of distributions does not constitute an event of default of the insurance or reinsurance undertaking;
- (vi) the cancellation of distributions imposes no restrictions on the insurance or reinsurance undertaking.

The terms of the contractual arrangement governing the own-fund item:

- do not require distributions to be made on the items in the event of a distribution being made on any other security relating to an own-fund item issued by the undertaking;
- do not require the payment of distributions to be cancelled or prevented on any other item of the undertaking in the event that no distribution is made in respect of the item; and
- do not provide for the linking of the payment of distributions to any other event or transaction which has the same economic effect as in the first or second bullet point above.

Absence of encumbrances

- (j) the basic own-fund item is free from encumbrances and is not connected with any other transaction, which when considered with the basic own-fund item, could result in that basic own-fund item not satisfying the requirements set out in OF.9.

OF.10.(Exchange or conversion and repayment)

For the purposes of this section, the exchange or conversion of a basic own-fund item into another Tier 1 basic own-fund item or the repayment or redemption of a Tier 1 own-fund item out of the proceeds of a new basic own-fund item of at least the same quality shall not be deemed to be a repayment or redemption, provided that the exchange, conversion, repayment or redemption is subject to the approval of the supervisory authority.

OF.11. The nominal or principal amount of the basic own-fund item shall absorb losses at the trigger event. Loss absorbency resulting from the cancellation of, or reduction in, distributions shall not be deemed to be sufficient to meet the requirement in OF.9 (d)bis for a principal loss absorbency mechanism.

OF.12. The trigger event referred to in OF.9 (d)bis is significant non-compliance with the Solvency Capital Requirement. Non-compliance with the Solvency Capital Requirement is significant where at least one of the following conditions is met:

- (a) the amount of own-fund items eligible to cover the Solvency Capital Requirement is equal to or less than the 75 % of the Solvency Capital Requirement;
- (b) the amount of own-fund items eligible to cover the Minimum Capital Requirement is equal to or less than Minimum Capital Requirement;
- (c) compliance with the Solvency Capital Requirement is not re-established within a period of three months of the date when non-compliance was observed.

Undertakings may specify in the provisions governing the instrument one or more trigger events in addition to the events referred to in points (a) to (c).

OF.13. For the purposes of points (d), (g) and (h) of OF.9, references to the Solvency Capital Requirement shall be read as references to the Minimum Capital Requirement in the event

that non-compliance with the Minimum Capital Requirement occurs before non-compliance with the Solvency Capital Requirement.

OF.14. For the purposes of OF.9 (i) and in the case of an item referred to in OF.3 (1) (a) and (b),

- (a) The level of distribution may not in any way be linked to the amount paid in at issuance and is not subject to a contractual cap (except to the extent that an undertaking is unable to pay distributions that exceed the level of distributable items);
- (b) There are no preferential distributions of income or capital, including in relation to other items referred to in paragraphs (1) (a) and (b) of OF.3 OF.16, and the terms governing the instruments do not provide preferential rights for the payment of distributions;
- (c) Distributable items shall comprise retained earnings, including profit for the year ended prior to the year of distribution, and distributable reserves as defined under national law or by the statutes of the undertaking, reduced by the deduction of any interim net loss for the current financial year from retained earnings;
- (d) The amount of distributable items shall be determined on the basis of the individual accounts of the undertaking and not on the basis of consolidated accounts;
- (e) Where national law imposes a restriction on an undertaking's distributable items by reference to consolidated accounts, this restriction shall be reflected in the determination of the undertaking's distributable items;
- (f) The terms of the contractual arrangements governing the own-fund item and any terms in any other own-fund item shall not pre-define the level or amount of distribution to be made on the item referred to in paragraphs (1) (a) and (b) of OF.3, including pre-defining the distribution at zero;
- (g) The terms of the contractual arrangement governing the own-fund item does not require a distribution to be made in the event of a distribution being made on any other item issued by the undertaking.

Principal loss absorbency mechanisms

OF.15.

For the purposes of OF.9 (d)bis

- (a) The loss absorbency mechanism to be used, including the trigger point, is clearly defined in the terms of the contractual arrangement governing the own-fund item and legally certain;
- (b) The loss absorbency mechanism achieves effective loss absorbency at the point of the trigger, without delay and regardless of any requirement to notify holders of the item;
- (c) Any write-down mechanism that does not allow for future write-up provides that the amounts written down in accordance with OF.9 (d)bis cannot be restored;
- (d) Any write-down mechanism that allows for a future write-up of the nominal or principal amount provides that:

- (i) Write-up is permitted only after the undertaking has achieved compliance with the Solvency Capital Requirement;
 - (ii) Write-up is not activated by reference to own-fund items issued or increased in order to restore compliance with the Solvency Capital Requirement;
 - (iii) Write-up only occurs on the basis of profits which contribute to distributable items made subsequent to the restoration of compliance with the Solvency Capital Requirement in a manner that does not undermine the loss absorbency intended by OF.9 (dbis) ;
- (e) Any conversion mechanism provides that:
- (i) the basis on which the security relating to an own-fund item converts into ordinary share capital on significant non-compliance with the Solvency Capital Requirement is specified clearly in the terms of the contractual arrangement governing the security;
 - (ii) the conversion terms do not fully compensate the nominal amount of a holding by allowing an uncapped conversion rate in the event of falls in the share price;
 - (iii) the maximum number of shares the holder of the security might receive shall be certain at the time of issuance of the security;
 - (iv) the conversion will result in a situation where losses are absorbed on a going concern basis and the basic own-fund items that arise as a result of the conversion do not hinder re-capitalisation;
 - (v) the choice of a conversion rate takes into account the impact on the scope for and timing of any future recapitalisation; and
 - (vi) shares are available to be issued, so sufficient shares have already been authorised in accordance with national law or the statutes of the undertaking.

OF.16. For the purposes of OF.9 (c) and in the case of an item referred to in OF.3 (1) (a), (b), (c), (e) and (2), an item is only immediately available to absorb losses if the item is paid in and there are no conditions or contingences in respect of its ability to absorb losses.

OF.2.2. Tier 2 Basic Own Funds

OF.17. Basic own-fund items shall be classified in Tier 2 where they are listed in OF.18 and display the features set out in OF.20.

OF.18. The following basic own-fund items shall be classified in Tier 2, where those items display the features set out in section OF.20.

- (1) the part excess of assets over liabilities, valued in accordance with Article 75 and Section 2 of Chapter VI of Directive 2009/138/EC, comprising the following items:
 - (a) ordinary share capital and the related share premium account;
 - (b) initial funds, members' contributions or the equivalent basic own-fund item for mutual and mutual-type undertakings;
 - (c) subordinated mutual member accounts;
 - (d) preference shares and the related share premium account;
- (2) Subordinated liabilities valued in accordance with Article 75 of Directive 2009/138/EC.

Time period between call and payment for unpaid share capital or members' contributions

OF.19.

For the purposes of OF.18 (1) (a), (b) and (d),

- (a) unless specified under national law, the time period between calling on shareholders or members to pay and the item becoming paid in shall not be longer than 3 months. During this time the own funds are considered called up but not paid in and are classified as Tier 2 basic own funds provided that all other relevant criteria are met.
- (b) for items which are called up but not paid in, the shareholder or member of the item shall still be obliged to pay the outstanding amount in the event of the undertaking becoming insolvent or entering into winding-up procedures prior to payment on called up items being received, and the amount shall be available to absorb losses.

OF.20. The basic own-fund items listed in OF.18 shall display the following features in order to be classified as Tier 2.

Own-fund items may classify under the transitional provisions as set out in section 4 (OF. 40 and OF.41) so that an assessment against the following criteria is not needed.

Subordination

- (a) the basic own-fund item ranks after the claims of all policy holders and beneficiaries and non-subordinated creditors;

Absence of features causing or accelerating insolvency

- (b) the basic own-fund item does not include features which may cause the insolvency of the insurance or reinsurance undertaking or may accelerate the process of the undertaking becoming insolvent;

Duration

- (c) the basic own-fund item is undated or has an original maturity of at least 10 years; the first contractual opportunity to repay or redeem the basic own-fund item does not occur before 5 years from the date of issuance;

For this purpose: The item does not include a contractual term providing for a call option prior to 5 years from the date of issuance, including call options predicated on unforeseen changes, outside the control of the undertaking, related to the treatment of an own-fund item. Subject to all relevant criteria being met and to prior supervisory approval, arrangements predicated on unforeseen changes which are outside the control of the undertaking, that would give rise to transactions or arrangements which are not deemed to be repayment or redemption shall be permitted.

Discretion on repayment or redemption and incentives to redeem

- (d) the basic own-fund item is only repayable or redeemable at the option of the insurance or reinsurance undertaking and the repayment or redemption of the basic own-fund item is subject to prior supervisory approval;

For this purpose: The terms of the item or any associated arrangement may include limited incentives to redeem as set out in section OF.31. The item shall be treated as repaid or redeemed with effect from the date of notice to holders of the item or the date of supervisory approval, if no notice is required, and shall be excluded from own funds as at that date.

- (d)bis the basic own-fund item may include limited incentives to repay or redeem that basic own-fund item, provided that these do not occur before 10 years from the date of issuance;

Suspension of repayment or redemption in case of non-compliance with the SCR

- (e) the basic own-fund item provides for the suspension of repayment or redemption of that item in the event that there is non-compliance with the Solvency Capital Requirement or repayment or redemption would lead to such non-compliance until the undertaking complies with the Solvency Capital Requirement and the repayment or redemption would not lead to non-compliance with the Solvency Capital Requirement;

- (e)bis notwithstanding point (e), the basic own-fund item may only allow for the repayment or redemption of that item in the event that there is non-compliance with the Solvency Capital Requirement or repayment or redemption would lead to such non-compliance, where the following conditions are met:

- (i) the supervisory authority has exceptionally waived the suspension of repayment or redemption of that item;
- (ii) the item is exchanged for or converted into another Tier 1 or Tier 2 basic own-fund item of at least the same quality;
- (iii) the Minimum Capital Requirement is complied with after the repayment or redemption.

Deferral of distributions in case of non-compliance with the SCR

- (f) the basic own-fund item,
- (i) in the case of items referred to in points (a) and (b) of OF.18, either the legal or contractual arrangements governing the item or national legislation allow for the distributions in relation to that item to be deferred in the event that there is non-compliance with the Solvency Capital Requirement or the distribution would lead to such non-compliance until the undertaking complies with the Solvency Capital Requirement and the distribution would not lead to non-compliance with the Solvency Capital Requirement;

- (ii) in the case of items referred to in points (1) (c), (d) and (2) of OF.18 the terms of the contractual arrangement governing the own-fund item provide for the distributions in relation to that item to be deferred in the event that there is non-compliance with the Solvency Capital Requirement or the distribution would lead to such non-compliance until the undertaking complies with the Solvency Capital Requirement and the distribution would not lead to non-compliance with the Solvency Capital Requirement;
- (f)bis notwithstanding point (f), the basic own-fund item may only allow for a distribution to be made in the event that there is non-compliance with the Solvency Capital Requirement or the distribution on a basic-own-fund item would lead to such non-compliance, where the following conditions are met:
- (i) the supervisory authority has exceptionally waived the deferral of distributions;
 - (ii) the payment does not further weaken the solvency position of the insurance or reinsurance undertaking;
 - (iii) the Minimum Capital Requirement is complied with after the distribution is made.

Absence of encumbrances

- (g) the basic own-fund item is free from encumbrances and shall not be connected with any other transaction, which when considered with the basic own-fund item, could result in that basic own-fund item not satisfying the requirements set out in OF.OF.1720.

Grading down

- (h) the basic own-fund item displays the features set out in section OF.9 that are relevant for basic own-fund items referred to in points (1) (c), (e) and (2) of OF.3, but exceeds the limit set out in OF.44.

OF.21. (Exchange or conversion and repayment)

For the purposes of this section, the exchange or conversion of a basic own-fund item into another Tier 1 or Tier 2 basic own-fund item or the repayment or redemption of a Tier 2 basic own-fund item out of the proceeds of a new basic own-fund item of at least the same quality shall not be deemed to be a repayment or redemption, provided that the exchange, conversion, repayment or redemption is subject to the approval of the supervisory authority.

OF.22. For the purposes of points (e) and (f) of OF.20, references to the Solvency Capital Requirement shall be read as references to the Minimum Capital Requirement in the event that non-compliance with the Minimum Capital Requirement occurs before non-compliance with the Solvency Capital Requirement.

For the purposes of OF.20 (b), OF.9 (b) shall apply to Tier 2 basic own-fund items in the same way it does to items referred to in OF.3 (1) (c), (e) and (2).

OF.23. For the purposes of OF.20 (f), the terms of the contractual arrangement governing the own-fund item are such that the operation of the deferral overrides the requirement to redeem at contractual maturity.

OF.2.3. Tier 3 Basic own-funds

List of own-funds items

OF.24. Any basic own-fund items which do not fall under OF.3 or OF.18 shall be classified in Tier 3.

OF.25. The following basic own-fund items shall be classified in Tier 3, where those items display the features set out in OF.26:

- (1) the part of the excess of assets over liabilities, valued in accordance with Article 75 and Section 2 of Chapter VI of Directive 2009/138/EC, comprising the following items:
 - (a) subordinated mutual member accounts;
 - (b) preference shares and the related share premium account;
 - (c) an amount equal to the value of net deferred tax assets;
- (2) subordinated liabilities valued in accordance with Article 75 of Directive 2009/138/EC.

Features determining classification

OF.26.

The basic own-fund items listed in OF.25 shall display the following features in order to be classified as Tier 3.

Own-fund items may classify under the transitional provisions as set out in OF.4 so that an assessment against the following criteria is not needed.

Subordination

- (a) the basic own-fund item, in the case of items referred to in points (1) (a), (b) and (2) of OF.25, ranks after the claims of all policy holders and beneficiaries and non-subordinated creditors;

Absence of features causing or accelerating insolvency

- (b) the basic own-fund item does not include features which may cause the insolvency of the insurance or reinsurance undertaking or may accelerate the process of the undertaking becoming insolvent;

Duration

- (c) the basic own-fund item, in the case of items referred to in points (1) (a), (b) and (2) of OF.25, is undated or has an original maturity of at least 5 years, where the maturity date is the first contractual opportunity to repay or redeem the basic own-fund item;

For this purpose: The item does not include a contractual term providing for a call option prior to 5 years from the date of issuance, including call options predicated on unforeseen changes, outside the control of the undertaking, related to the treatment of

an own fund item. Subject to all relevant criteria being met and to prior supervisory approval, arrangements predicated on unforeseen changes which are outside the control of the undertaking, that would give rise to transactions or arrangements which are not deemed to be repayment or redemption shall be permitted.

Repayment or redemption and limited incentives to redeem

- (d) the basic own-fund item, in the case of items referred to in points (1) (a), (b) and (2) of OF.25, is only repayable or redeemable at the option of the insurance or reinsurance undertaking and the repayment or redemption of the basic own-fund item is subject to prior supervisory approval;

For this purpose: The terms of the item or any associated arrangement may include limited incentives to redeem as set out in section OF.2.4 (OF.31.). The item shall be treated as repaid or redeemed with effect from the date of notice to holders of the item or the date of supervisory approval, if no notice is required, and shall be excluded from own funds as at that date.

- (d)bis the basic own-fund item, in the case of items referred to in points (1) (a), (b) and (2) of OF.25, may include limited incentives to repay or redeem that basic own-fund item;

Suspension of repayment or redemption in case of non-compliance with the SCR

- (e) the basic own-fund item, in the case of items referred to in points (1) (a), (b) and (2) of OF.25, provides for the suspension of repayment or redemption in the event that there is non-compliance with the Solvency Capital Requirement or repayment or redemption would lead to such non-compliance until the undertaking complies with the Solvency Capital Requirement and the repayment or redemption would not lead to non-compliance with the Solvency Capital Requirement;

For this purpose: The terms of the contractual arrangement governing the own-fund item include provision for the suspension of the repayment or redemption of the item at any point up until the date of repayment or redemption in the event of non-compliance with the Solvency Capital Requirement or if the repayment or redemption would result in such non-compliance.

- (e)bis notwithstanding point (e) of paragraph 1, the basic own-fund item may only allow for the repayment or redemption of that item in the event that there is non-compliance with the Solvency Capital Requirement or repayment or redemption would lead to such non-compliance, where the following conditions are met:

- (i) the supervisory authority has exceptionally waived the suspension of repayment or redemption of that item;
- (ii) the item is exchanged for or converted into another Tier 1, Tier 2 basic own-fund item or Tier 3 basic own-fund item of at least the same quality;
- (iii) the Minimum Capital Requirement is complied with after the repayment or redemption.

Deferral of distributions in case of non-compliance with the SCR

- (f) the basic own-fund item, in the case of items referred to in points (1) (a), (b) and (2) of OF.25, provides for the deferral of distributions in the event that there is non-compliance with the Minimum Capital Requirement or the distribution would lead to

such non-compliance until the undertaking complies with the Minimum Capital Requirement and the distribution would not lead to non-compliance with the Minimum Capital Requirement;

For the purposes of OF.26 (f), the terms of the contractual arrangement governing the own-fund item are such that the operation of the deferral overrides the requirement to redeem at contractual maturity.

Absence of encumbrances

- (g) the basic own-fund item is free from encumbrances and is not connected with any other transaction, which when considered with the subordinated liability, could undermine the features that the item is required to possess in accordance with OF.25.

OF.27. (Exchange or conversion and repayment)

For the purposes of this section, the exchange or conversion of a basic own-fund item into another Tier 1, Tier 2 basic own-fund item or Tier 3 basic own-fund item or the repayment or redemption of a Tier 3 basic own-fund item out of the proceeds of a new basic own-fund item of at least the same quality shall not be deemed to be a repayment or redemption, provided that the exchange, conversion, repayment or redemption is subject to the approval of the supervisory authority.

OF.28. For the purpose of point (e) of OF.26, references to the Solvency Capital Requirement shall be read as references to the Minimum Capital Requirement in the event that non-compliance with the Minimum Capital Requirement occurs before non-compliance with the Solvency Capital Requirement.

OF.29. For the purposes of OF.26 (b), OF.9 (b) shall apply to Tier 3 basic own-fund items in the same way it does to items referred to paragraph OF.3 (1) (c), (e) and (2).

OF.2.4. Encumbrance and Incentives to Redeem

Encumbrances

OF.30.

For the purposes of OF.9 (j), OF.20 (g) and OF.26 (g):

- (a) The assessment as to whether an own-funds item is encumbered shall be made on the basis of the economic effect of the encumbrance and the nature of the item, applying the principle of substance over form.
- (b) Encumbrances shall include, but shall not be limited to:
- (i) rights of set off;

- (ii) restrictions;
 - (iii) charges or guarantees;
 - (iv) holding of own-fund items of the undertaking;
 - (v) the effect of a transaction or a group of connected transactions which have the same effect as any of (i) to (iv) above, and
 - (vi) the effect of a transaction or a group of connected transactions which otherwise undermine an item's ability to meet the criteria for classification as an own-fund item.
- (c) An encumbrance arising from a transaction or group of transactions which is equivalent to the holding of own shares includes the case where an undertaking holds its own Tier 1, Tier 2 or Tier 3 items.
 - (d) Where the encumbrance is equivalent to the holding of own shares, the undertaking shall reduce the reconciliation reserve by the amount of the encumbered item.
 - (e) If an item is encumbered to the extent that it no longer satisfies the criteria for classification, the item shall not be classified as own funds.
 - (f) If an item is encumbered but when the effect of the encumbrance is taken into account, it meets the criteria for a lower tier of own funds, the item shall be classified on the basis of the combined characteristics of the item and the encumbrance.

Incentives to redeem

OF.31.

- (1) For the purposes of OF.9 (f), OF.20 (d) and OF.26 (d), undertakings shall consider incentives to redeem that are not limited as not permitted in any tier.
- (2) Incentives to redeem that are not limited include:
 - (a) principal stock settlement combined with a call option;
 - (b) mandatory conversion combined with a call option;
 - (c) a change in the distribution structure from a fixed to a floating rate combined with a call option;
 - (d) an increase in the principal amount which is applicable subsequent to the call date, combined with a call option;
 - (e) any other provision or arrangement which might reasonably be regarded as providing an economic basis for the likely redemption of the item.
- (3) In the case of items referred to in OF.18, undertakings shall be able to include limited incentives to redeem if they do not occur before 10 years after the issue date of the item. In the case of items referred to in OF.25, undertakings shall be able to include limited incentives if they do not occur before 5 years after the issue date of the item.
- (4) Incentives to redeem in the form of a step-up associated with a call option are limited if the step-up takes the form of a single increase in the coupon rate and results in an

increase over the initial rate that is no greater than the higher of the following two amounts:

- (a) 100 basis points, less the swap spread between the initial index basis and the stepped-up index basis; or
- (b) 50% of the initial credit spread, less the swap spread between the initial index basis and the stepped-up index basis.

OF.2.5. Tier 2 Ancillary own-funds

OF.32. Ancillary own funds are items of capital other than basic own-funds which can be called up to absorb losses. They can comprise the following items to the extent they are not basic own-funds items:

- (1) Unpaid share capital or initial fund that has not been called up;
- (2) Letters of credit or guarantees;
- (3) Any other legally binding commitments received by insurance and reinsurance undertakings.

OF.33. Ancillary own funds are subject to prior supervisory approval. The inclusion of an item into ancillary own funds for the purposes of the stress test is not to be considered as a pre-approval of the item.

OF.34. For the purposes of the stress test, the following ancillary own-fund items which are currently used to meet solvency requirements under Solvency I may be classified as Tier 2 ancillary own funds at the amounts at which they are currently recognised or approved:

- (1) Letters of credit and guarantees which are held in trust for the benefit of insurance creditors by an independent trustee and provided by credit institutions authorised in accordance with Directive 2006/48/EC.
- (2) Any future claims which mutual or mutual-type associations of ship owners with variable contributions solely insuring risks to ships (sea, lake and river and canal vessels), liability for ships (sea, lake and river and canal vessels) and the legal expenses and costs of litigation, that may have against their members by way of a call for supplementary contributions, within the next 12 months.
- (3) Any future claims which mutuals or mutual-type associations with variable contributions may have against their members, within the following 12 months, that do not fall under (2) above and which are currently eligible to meet solvency requirements under the Solvency I regime.

OF.35. If any other item is currently eligible to meet solvency requirements and could constitute ancillary own funds under Solvency II then it may for the purpose of the stress test exercise also be classified as Tier 2 ancillary own funds provided that it represents own-fund items which, if called up and paid in, would be classified in Tier 1. Otherwise the item may be classified as Tier 3 ancillary own funds.

OF.36. Details are to be provided regarding the arrangements in OF.35. together with an explanation as to why this item should be treated as ancillary own funds, subject to supervisory approval, once Solvency II is in force.

OF.37. Items or arrangements which currently exist but which do not count towards the available solvency margin may in the future be approved as Tier 2 ancillary own funds. These are not included in own funds for stress test purposes but details regarding these arrangements including the amount together with an explanation why this item should be treated as Tier 2 ancillary own funds, subject to supervisory approval, once Solvency II is in force may be provided.

OF.2.6. Tier 3 Ancillary own-funds

OF.38. For the purpose of the stress test existing arrangements currently eligible to meet solvency requirements which would constitute ancillary own funds under Solvency II, but which would not be eligible as Tier 2 ancillary own funds because that item would not be classified in Tier 1 if it were called up and paid in may be classified as Tier 3 ancillary own funds.

OF.39. Items or arrangements which currently exist but which do not count towards the available solvency margin may in the future be approved as Tier 3 ancillary own funds. These are not included in own funds for the stress test purposes but details regarding these arrangements including the amount together with an explanation why this item should be treated as Tier 3 ancillary own funds, subject to supervisory approval, once Solvency II is in force may be provided.

OF.3. Items not on the list

Where a basic own-fund item is not covered by the lists set out in articles OF.3, OF.18, OF.25 but (a) can be used to meet the available solvency margin in accordance to existing laws, regulations and administrative provisions, and (b) displays the features set out in section OF.9, OF.20 or OF.26, it may be considered as basic own funds for the purpose of these technical specifications. However, undertakings should not assume approval.

OF.4. Transitional Measure

Undertakings should assess all basic own-fund items to determine whether they meet the features for classification under OF.9, OF.20 and OF.26. Where the features for classification

in a particular tier are met, the item should be classified in that tier and should not be subject to transitional measures.

Own-fund items included in Tier 1 by virtue of the transitional measures, when added to other items listed in OF.44, are limited to 20 % of total Tier 1. Basic own-fund items included in Tier 2 by virtue of the transitional measures are added to other Tier 2 own-fund items for the purposes of applying the limits as set out in OF.5.

Undertakings should assess all basic own-fund items to determine whether they meet the features for classification under OF.9, OF.20 and OF.26. Where the features for classification in a particular tier are met, the item should be classified in that tier and should not be subject to transitional measures.

Own-fund items included in Tier 1 by virtue of the transitional measures, when added to other items listed in OF.44, are limited to 20 % of total Tier 1. Basic own-fund items included in Tier 2 by virtue of the transitional measures are added to other Tier 2 own-fund items for the purposes of applying the limits as set out in OF.5.

4.1 Transitional measures – Classification of items in Tier 1

OF.40. Basic own-fund items that:

(1) Can be used to meet the available solvency margin up to 50 % of the solvency margin according to the laws, regulations and administrative provisions which are adopted pursuant to Article 16(3) of Directive 73/239/EEC, Article 1 of Directive 2002/13/EC, Article 27 (3) of Directive 2002/83/EC and Article 36 (3) of Directive 2005/68/EC;

(2) would not otherwise be classified in Tier 1 or Tier 2 in accordance with OF.9 or OF.18 shall be included in Tier 1 basic own funds.

4.2 Transitional measures – Classification of items in Tier 2

OF.41. Basic own-fund items that can be used to meet the available solvency margin up to 25 % of the solvency margin according to the laws, regulations and administrative provisions which are adopted pursuant to Article 16 (3) of Directive 73/239/EEC, Article 1 of Directive 2002/13/EC, Article 27 (3) of Directive 2002/83/EC and Article 36 (3) of Directive 2005/68/EC shall be included in Tier 2 basic own funds.

OF.5. Eligibility of Own Fund

OF.42. As far as compliance with the Solvency Capital Requirement is concerned:

(a) the proportion of Tier 1 items in the eligible own funds shall be at least one half of the Solvency Capital Requirement;

(b) the eligible amount of Tier 3 items shall be less than 15 % of the Solvency Capital Requirement.

OF.43. As far as compliance with the Minimum Capital Requirements is concerned, the proportion of Tier 1 items in the eligible basic own funds shall be at least 80 % of the Minimum Capital Requirement.

OF.44. Within the limit referred to OF.42 (a) and OF.43, the sum of the following basic own-fund items (restricted Tier 1 items) shall make up less than 20 % of the total amount of Tier 1 items:

(a) items referred to in point (1) (c) of OF.3;

(b) items referred to in point (1) (e) of OF.3;

(c) items referred to in point (2) of OF.3;

(d) items that are included in Tier 1 basic own funds under the transitional arrangements set out in OF.40 and OF.41.

DRAFT

SECTION 5 – GROUPS

G.1. Introduction

G.1.1. Calculation of the group solvency: description of the methods

G.1. Groups should calculate their group Solvency Capital Requirement and their group own funds according to the Accounting Consolidation-based method (Method 1: default method).

For the purpose of the stress test exercise, groups in the Internal Model pre application process should report the solvency capital requirements on the basis of the Standard Formula, but they are welcome to send also the IM results on a voluntary basis.

G.2. The Deduction & Aggregation method (Method 2) or a combination of methods is possible when:

- (a) the amount and quality of information available in relation to a related undertaking would not be sufficient for it to be subject to method 1;
- (b) a related undertaking is not covered by a group internal model, in the cases where a group internal model, approved in accordance with Article 231 of Directive 2009/138/EC, is used for the calculation of the consolidated group Solvency Capital Requirement;
- (c) for the purpose of paragraph (b), the risks that are not captured in the group internal model are immaterial in relation to the overall risk profile of the group;
- (d) the use of method 1 in relation to a related undertaking would be overly burdensome and the nature, scale and complexity of the risks of the group are such that the use of method 2 in relation to a related undertaking – or several related undertakings – does not materially affect the results of the group solvency calculation;
- (e) intra-group transactions are not significant both in terms of volume and value of the transaction.

G.3. For the Stress Test exercise, groups that want to use the deduction and aggregation method or a combination of methods should discuss it with their group supervisors. Any decision of the group supervisor taken in this regard is relevant only for the purpose of the Stress Test and it cannot be regarded as a final decision on the choice of the calculation for Solvency II.

G.1.2 Scope

G.4. Calculations should be carried out at the level of the ultimate EEA participating insurance undertaking, insurance holding company or mixed financial holding company (i.e. the EEA entity which normally issues consolidated accounts) and

encompass the “group” as defined in Article 212 of the Directive 2009/138/EC. In general, for a solvency assessment participations in entities that are excluded from the scope of the group supervision according to Article 3.3 of the IGD (art. 214 of Directive 2009/138/EC) may be deducted from the own funds for the group solvency.

G.5. All parts of the group necessary to ensure a proper understanding of the group and the potential sources of risks within the group have to be included within the scope of group for the purpose of properly assessing group solvency.

G.1.3. Assumptions for the treatment of third country related insurance undertakings and third country groups

G.6. The Directive 2009/138/EC sets out specific provisions for the treatments of non-EEA insurance activities in the following cases:

- i. EEA groups that have a related (re)insurance third country undertaking;
- ii. non-EEA groups that have a related (re)insurance undertaking in the EEA;
- iii. reinsurance activities of non-EEA undertakings that reinsure EEA undertakings or groups.

G.7. These three scenarios are subject to an equivalence assessment as laid out in the Directive 2009/138/EC. However, the equivalence assessments and any decisions thereof will not be available for the purposes of the stress test exercise. The following paragraphs give guidance on the required treatments.

a. EEA groups that have a related third country (re)insurance undertaking

G.8. When using the deduction and aggregation method for the inclusion of third country (re)insurance undertakings, groups are allowed to use solvency capital requirements and eligible own funds of related third country (re)insurance undertakings calculated according to their local rules, without prejudice to any future European Commission equivalence determinations and any future decisions of the group supervisor.

b. Non-EEA headquartered groups that have an EEA subgroup

G.9. Where a group which has its head office in a third country has a sub-group in the EEA, the group should calculate its group solvency using the Solvency II rules at the level of the EEA subgroup.

G.10. The group calculations should be performed at the level of the ultimate parent undertaking in the Union. Where more than one subgroup exists within the Union, groups should undertake a group calculation for each subgroup.

G.11. Participating groups in the stress test exercise from Switzerland can follow full Swiss regulatory requirements (i.e. Swiss Solvency Test).

c. Reinsurance activities of non-EEA undertakings that reinsure EEA undertakings or groups

G.12. As regards risk mitigation provided by third country reinsurers this should be considered as if it were risk mitigation provided by EEA reinsurers when doing the calculations with the standard formula and, where relevant, with an internal model.

G.1.4. Availability of group own funds

G.13. In order to assess group solvency, it is necessary to determine the amount of group own funds which are eligible to cover the group SCR. This assessment has to be made after the elimination of double use of eligible own funds within the group irrespective of the calculation methods (method 1, D&A or combination of methods).

G.14. The assessment needs to consider the availability of the own funds of each related (re)insurance undertaking, ancillary service undertaking, special purpose vehicle, insurance holding company and mixed financial holding company within the scope of group solvency. This means that own funds that cannot be made either fungible (i.e. absence of dedication to absorb only certain losses) or transferable (i.e. absence of significant obstacles to moving own funds items from one entity of the group to another) for the group within a maximum of 9 months cannot be considered effectively available at group level.

G.2. Accounting consolidation-based method

G.2.1. Determination of consolidated data for the calculation of group solvency according to method 1

G.15. This subsection describes how groups should determine the consolidated data for the calculation of the group solvency according to the accounting consolidation-based method.

G.16. Groups should calculate the consolidated data as follows:

a) full consolidation of data of all the insurance or reinsurance undertakings, third-country insurance or reinsurance undertakings, insurance holding companies, mixed financial holding companies and ancillary services undertakings which are subsidiaries of the parent undertaking;

b) full consolidation of data of special purpose vehicles to which the participating undertaking or one of its subsidiaries has transferred risks, with the exception of: special purpose vehicles which either are defined in Article 13(26) of Directive 2009/138/EC and comply with the requirements set out in Article 211 of that Directive or where applicable with the Member State law in accordance with article 211(3) of that directive and special purpose vehicle which are regulated by a third country supervisory authority and comply with requirements equivalent to those set out in Article 211(2) of Directive 2009/138/EC;

c) proportional consolidation of data of the insurance or reinsurance undertakings, third-country insurance or reinsurance undertakings, insurance holding companies, mixed financial holding companies and ancillary services undertakings managed by an undertaking included in point a) above together with one or more undertakings not included in point a) above, where those undertakings' responsibility is limited to the share of the capital they hold;

d) on the basis of the adjusted equity method, data of all holdings in related insurance or reinsurance undertakings, third-country insurance or reinsurance undertakings, insurance holding companies and mixed financial holding companies, which are not subsidiaries of the parent undertaking and which are not considered under points (a) and (c) above;

e) the proportional share of the undertakings' own funds calculated according to the relevant sectoral rules, as referred to in Article 2(7) of Directive 2002/87/EC, in relation to holdings in related undertakings which are credit institutions, investment firms and financial institutions, alternative investment fund managers, asset management companies, institutions for occupational retirement provision within the meaning of Directive 2003/41/EC, non-regulated undertakings carrying out financial activities;

f) participations in all other related undertakings outside the financial sector (both dominant and significant influence) should be consolidated in accordance with section V.8., paragraph 2, this means that the relevant capital requirements (inter alia equity risk capital requirement and the concentration risk capital requirement) are to be calculated on the value of that participation on the basis of the provisions set out in the sections SCR.543 and SCR.5.128-SCR.5.133.

In case of related collective investment undertakings in the scope of the group, those undertakings would fall under letter (f) and would be consolidated in accordance with V.8, paragraph 2.

G.17. Consolidated group own funds should be net of any intra-group transactions.

G.18. For the purpose of the Stress Test exercise, participations in related undertakings which are credit institutions, investment firms and financial institutions, alternative investment fund managers, asset management companies, institutions for occupational retirement provision within the meaning of Directive 2003/41/EC and non-regulated undertakings carrying out financial activities, as described in G.16(e), should be deducted from the consolidated data which is used for the calculation of group solvency. If the banking activities are non-material to the group they can be included for simplicity.

G.2.2. Group Technical Provisions

G.19. The group best estimate of insurance liabilities should be the sum of:

- (a) the best estimate of the participating insurance or reinsurance undertaking calculated in accordance with Articles 75 to 86 of Directive 2009/138/EC;
- (b) the proportional share of the best estimate, calculated in accordance with Articles 75 to 86 of Directive 2009/138/EC, of related insurance or reinsurance undertakings and third-country insurance or reinsurance undertakings referred to letter (a) and (c) of paragraph G.16.

The calculation above should be inclusive of any long term guarantee measure applied at individual level.

The calculation above should consider the proportional share of the related undertaking that is included in the consolidated accounts. When the proportional share used in the consolidated accounts is 100% for a related undertaking, the proportional share should be 100%.

G.20. The best estimates described above should be net of any intra-group transactions. In case of reinsurance contracts, the following adjustments shall be made:

- (a) the best estimate of the undertaking that accepts risks shall not include the cash-flows arising from the obligations of the intra-group reinsurance contracts;
- (b) the undertaking that cedes the risk shall not recognise the amounts recoverable from the intra-group reinsurance contracts.

G.21. In case an undertaking of the group referred to letter (a) and (c) of paragraph G.16 applies the Matching Adjustment in the calculation of the best estimate of its portfolio of life insurance obligations or reinsurance obligations, including annuities stemming from non-life insurance or reinsurance contracts at the individual level, the part of the best estimates calculated with the application of the Matching Adjustment should be considered at group level gross of any intra-group transactions. The portfolio of assets and liabilities used as a basis for the application of the Matching Adjustment should be treated as ring fenced funds from a group perspective and follow the rules laid down in section G.2.4. letter d).

G.22. In relation to the third country undertakings referred to letter (a) and (c) of paragraph G.16, groups should calculate the technical provisions in accordance with Articles 75 to 86 of Directive 2009/138/EC, including the Long Term Guarantee measures. In case of application of the transitional measures, the transition should be considered from the current third country regime to Solvency II.

G.23. The risk margin of technical provisions for a group should be equal to the sum of the following:

- (a) the risk margin of the participating insurance or reinsurance undertaking;
- (b) the proportional share of the participating undertaking in the risk margin of the related insurance or reinsurance undertakings and third-country insurance or reinsurance undertakings referred letter (a) and (c) of paragraph G.16.

G.2.3. Consolidated group SCR

G.24. Groups should calculate the consolidated group solvency capital requirement as the sum of:

- a) the solvency capital requirement calculated on the basis of (fully and proportionally) consolidated data referred to in letter a) to c) of par. G.16 following the rules laid down in Title I, Chapter VI, Section 4 of Directive 2009/138/EC (SCR^{diversified});
- b) the proportional share of the solvency capital requirements of each related insurance or reinsurance undertakings and insurance holding companies or mixed financial holding company which are not subsidiary undertakings. In particular, also for related EEA and non EEA insurance holding companies or mixed financial holding companies and non EEA (re)insurance undertakings, which are not subsidiaries, the individual solvency capital requirement, solely for the purpose of the group solvency calculation, should be calculated in accordance with articles 100 to 127 of Directive 2009/138/EC as they were insurance and reinsurance undertakings in the Community (SCR_{npc}).
- c) the proportional share of the capital requirements for credit institutions, investment firms, financial institutions, alternative investment fund managers, asset management companies, and institutions for occupational retirement provision within the meaning of Directive 2003/41/EC, calculated according to the relevant sectoral rules and the proportional share of the notional capital requirements of non-regulated undertakings carrying out financial activities;
- d) the solvency capital requirements of other related undertakings referred to letter e) of par. G.16 (SCR^{OT}).

G.25. For the purpose of the Stress Test exercise, the proportional share of the relevant sectoral capital requirements of for credit institutions, investment firms, financial

institutions, alternative investment fund managers, asset management companies, and institutions for occupational retirement provision within the meaning of Directive 2003/41/EC and the proportional share of the notional capital requirements of non-regulated undertakings carrying out financial activities, as described in G.24 (c), should be deducted from the consolidated group SCR. If these capital requirements are non-material to the group they can be included for simplicity.

G.2.4. Additional guidance for the calculation of the consolidated group SCR

a. Adjustment for the loss-absorbing capacity of technical provisions

G.26. When using method 1 or the combination of methods (not when using the D&A method exclusively), the adjustment for the loss-absorbing capacity of technical provision should be applied to the (fully and proportionally) consolidated data determined in accordance with letter a) to c) of par. G.16

G.27. The group's net calculation should be derived on sub-modular level based on the following formula:

$$netSCR_{sub-module}^{group} = grossSCR_{sub-module}^{group} + \sum_{solo} \alpha^{solo} (grossSCR_{sub-module}^{solo} - netSCR_{sub-module}^{solo}) \bullet \min(1; \frac{FDB^{solo}}{grossSCR^{solo} - netSCR^{solo}})$$

where

- α^{solo} represents the percentage used for the establishment of the consolidated data,
 - FDB^{solo} represents the total amount of FDB at the individual level adjusted for intra group transaction, if necessary,

- $netSCR_{sub-module}^{solo}$ and $grossSCR_{sub-module}^{solo}$ should be determined taking into account the relevant scenario at group level as explained in the following paragraph,

- $grossSCR^{solo}$ and $netSCR^{solo}$ represent the aggregated $grossSCR_{sub-module}^{solo}$ and $netSCR_{sub-module}^{solo}$ for each solo undertaking by using the relevant correlation matrices.

G.28. When determining the loss-absorbing capacity of technical provisions at sub-module level, the group should consider the actual loss-absorbency of technical provisions of each solo (re)insurance undertaking that is (fully or partially) consolidated.

G.29. In particular, where the standard formula requires the choice between alternative scenarios, in order to derive the loss-absorbing capacity of technical provisions in the sub-modules of the group calculation, the scenario relevant for the group should be taken into account for each solo (re)insurance undertaking that is consolidated. A recalculation of the $netSCR_{sub-module}^{solo}$ and $grossSCR_{sub-module}^{solo}$ should thus be possible.

G.30. The limitation of the loss-absorbing effect of the technical provision to the amount of Future Discretionary Benefits (FDB) applies to both the loss-absorbing effect at the group level and at the solo level. The value of FDB at group level should correspond to the part of FDB relating to the fully or proportionally consolidated data of the group account.

G.31. The adjustment for loss-absorbency of technical provisions at group level should not exceed the sum of solo adjustments for loss absorbency of technical provisions of the fully or proportionally consolidated (re)insurance undertakings.

G.32. Alternatively to the calculation proposed in G.27, when there is a reasonable level of homogeneity among future discretionary benefits of the participating and (re)insurance undertakings that are consolidated within the group, the group should calculate the Loss Absorbing Capacity of technical provisions at group level according to the following formula:

$$Adj_{TP}^{group} = \frac{SCR^{diversifial}}{\sum_{solo} \alpha^{solo} SCR^{solo}} \cdot \sum_{solo} \alpha^{solo} \cdot Adj_{TP}^{solo}$$

where:

- Adj_{TP}^{solo} is the solo adjustment for the loss absorbing capacity of technical provision of each (re)insurance undertaking included in the consolidate data (par. G.24 letter a);
- α^{solo} represents the percentage used for the establishment of the consolidated data;
- the ratio $\frac{SCR^{diversifial}}{\sum_{solo} \alpha^{solo} SCR^{solo}}$ represents the proportional adjustment due to the

diversification effects at group level and, in particular, $SCR^{diversifial}$ is the SCR calculated on the basis of the consolidated data in accordance to paragraph G.24 letter a) and SCR^{solo} is the solvency capital requirement of each of each (re)insurance undertaking included in the consolidate data.

G.33. A reasonable level of homogeneity among future discretionary benefits of the participating and controlled (re)insurance entities within the group can be assessed in relation to the type of profit sharing mechanism of the portfolios (i.e. considering the type of financial guarantees) and in relation to the underlying types of assets held by the participating and controlled (re)insurance entities. For the purpose of assessing the level of homogeneity, the geographical localization of the group may be a relevant information (i.e. national or cross border groups).

b. Adjustment for the loss-absorbing capacity of deferred tax liabilities and assets

G.34. When using method 1 or the combination of methods (not when using the D&A method exclusively), The adjustment for the loss-absorbing capacity of deferred taxes

should be applied to the (fully and proportionally) consolidated data determined in accordance with letter a) to c) of par. G.16 (not when using the D&A method exclusively).

G.35. The group should calculate the adjustment for the loss absorbing capacity of deferred taxes according to the following formula:

$$Adj_{DT}^{group} = \frac{SCR^{diversified}}{\sum_{solo} \alpha^{solo} SCR^{solo}} \cdot \sum_{solo} \alpha^{solo} \cdot Adj_{DT}^{solo}$$

where

α^{solo} represents the percentage used for the establishment of the consolidated data,

Adj_{DT}^{solo} is the solo adjustment for the loss-absorbing effect of deferred taxes of each (re)insurance undertaking included in the consolidate data,

SCR^{solo} is the solo SCR after the adjustment for technical provisions and before the adjustment for deferred taxes of each (re)insurance undertaking included in the consolidate data, and

$SCR^{diversified}$ is the SCR calculated on the basis of the consolidated data in accordance to paragraph G.24.letter a.

c. **Determination of the currency for the purpose of the currency risk calculation**

G.36. Where the consolidated group Solvency Capital Requirement is calculated, wholly or in part, on the basis of the standard formula, the local currency referred to in the currency risk sub-module should be understood to be the currency used for the preparation of the group consolidated accounts.

G.37. The capital requirement for the currency risk should take account of any relevant risk mitigation instruments which meet the requirements set out in (SCR.11.1-SCR.11.34 and SCR.12.1-SCR.12.28).

G.38. If the consolidated SCR is calculated, wholly or in part, on the basis of the standard formula, all investments denominated in a currency pegged to the currency of the consolidated accounts should be taken into account in accordance with (SCR.5.75).

G.39. For the purposes of the stress test, where groups have also chosen to provide the consolidated group SCR using their internal model, the above considerations should be taken into account in the group's internal model.

d. Treatment of ring-fenced funds at the group level under method 1

- G.40. Groups must identify all material ring-fenced funds arrangements within the consolidated data (par. G.16, letter a) to c)) irrespective of whether the ring-fenced fund is within an EEA or a non-EEA insurance or reinsurance undertaking.
- G.41. Only for the purposes of calculating the notional SCR and the restricted RFF own funds (RFF own funds in excess of the RFF notional SCR), for each material ring-fenced fund no intra-group transactions should be eliminated between the assets and liabilities associated with each material ring-fenced fund and the remaining part of the consolidated data.
- G.42. Therefore, the notional SCR and the restricted RFF own funds for each material ring-fenced funds that belong to an EEA insurance operation in the consolidated data will be the same as the notional SCR and the restricted own funds calculated at the solo level. Also, no diversification should be recognised between a RFF and the remaining part of the consolidated data or other material ring-fenced funds.
- G.43. The total restricted ring-fenced fund own funds at the group level, to be deducted from the group reconciliation reserve, should be the sum of all material restricted ring-fenced funds own funds identified in the EEA insurance or reinsurance undertakings and the restricted ring-fenced funds own funds identified in the non-EEA insurance and reinsurance undertaking included within the consolidated data (G.16 letter a) to c)).
- G.44. Groups must eliminate intra-group transactions within the remaining part of the consolidated data (excluding assets and liabilities of all material ring-fenced funds but including the assets and liabilities of all non-material ring-fenced funds) when calculating the SCR for the remaining part of the consolidated data.
- G.45. Regardless of par. G.41, the calculation of group own funds should be based on the consolidated data that is net of all intra-group transactions and elimination of double use of capital (par. G.13 and G.17)

G.2.5. Minimum consolidated group SCR

a. General considerations

G.46. When using method 1 or the combination of methods for the consolidated part (not when using the D&A method exclusively) a minimum consolidated group SCR is applied and is equal to the sum of the following:

- a) the MCR of the participating insurance and reinsurance undertaking or the notional MCR of the insurance holding company or mixed financial holding company,
- b) the proportional share of the MCR of the related insurance and reinsurance undertakings and the proportional share of the notional MCR of the intermediate insurance and mixed financial holding company.

G.47. The solo MCR of the insurance and reinsurance undertaking used for the calculation of the minimum consolidated group SCR should be the MCR determined after applying the corridor referred to in Article 129(3) of the Directive 2009/138/EC or after applying the absolute floor referred to in Article 129(1) (d) of the Directive 2009/138/EC (see section of these technical specifications on the MCR).

G.48. The calculation above should consider the proportional share of the related undertaking that is included in the consolidated accounts. When the proportional share used in the consolidated accounts is 100% for a related undertaking, the proportional share should be 100 %.

G.49. The consolidated group SCR shall not be less than the minimum consolidated group solvency capital requirement calculated in accordance with section G.2.5(a).

b. Guidance for the calculation of the equivalent of the MCR for the insurance holding companies and for the third country insurance and reinsurance undertakings

G.50. The notional MCR for the insurance holding companies and mixed financial holding company should be 35% of their notional SCR, where 35% is the percentage in the middle of the corridor prescribed in Article 129(1) (d) of the Directive 2009/138/EC unless a different approach can be justified.

G.51. The solo MCR for third country insurance and reinsurance undertakings should be the local capital requirement under which the authorisation will be withdrawn in the third country by the local supervisor.

G.2.6. Consolidated group own funds

G.52. When applying the default method, eligible own funds at group level should be assessed as follows:

1. group own funds are calculated on the basis of the consolidated data defined in paragraphs G.16 to G.18 net of any intra-group transactions;
2. group own funds are classified into tiers;
3. available group own funds are calculated net of group adjustments relevant at group level (i.e. non available own funds assessed in accordance with G.13 and G.14 should be deducted from the group own funds);
4. eligible own funds are subject to the same tiering limits that apply at solo level in order to qualify to cover the group solvency capital requirement and the minimum consolidated group solvency capital requirement.

G.53. Groups should deduct the part of own funds of related (re)insurance undertakings, insurance holding companies and mixed financial holding companies that is not

available for covering the group solvency capital requirement from the relevant own funds item of the consolidated group own funds and the relevant tier.

a. Contribution of non-available own funds of the related undertakings to group own funds

G.54. In addition to surplus funds and any subscribed but not paid-up capital, ancillary own funds, preference shares, subordinated mutual members account, subordinated liabilities, net deferred tax assets, any other own fund-items that are not available should also be considered as not effectively available to cover the SCR of the participating insurance undertaking for which the group solvency is calculated. Such non-available own funds may cover the group SCR only in so far as they are eligible to cover the SCR of the related undertaking.

G.55. For each related undertaking, the sum of solo non-available own funds should be considered available for covering the group SCR up to the contribution of solo SCR to group SCR.

G.56. In order to assess the contribution of solo SCR to group SCR from entity j ($Contr_j$) included in the calculation of $SCR^{diversified}$ (for the entities for which diversification is recognised see paragraph G.24 letter a), the following proxy should be used:

$$Contr_j = SCR_j \times \frac{SCR^{diversified}}{\sum_i SCR_i^{solo}}$$

where:

- SCR_j is the solo SCR of the undertaking j ;
- $SCR^{diversified}$ = SCR calculated in accordance to par. G.24 letter a);
- SCR_i^{solo} is the solo SCR of the participating undertaking and each insurance and reinsurance undertaking and intermediate insurance holding company and intermediate mixed financial holding company that is included in the calculation of the $SCR^{diversified}$;
- the ratio is the proportional adjustment due to the recognition of diversification effects at group level.

For undertakings included in consolidated data with proportional consolidation, according to letter (c) of par. G.16, only the proportional share of the solo SCR is included in the above calculation.

G.57. When undertakings provide results on the basis of an internal model, in addition to the standard formula results, the attribution of diversification can be carried out using the internal model.

i. Minority interests

G.58. When applying the accounting consolidation-based method and for the consolidated part when using the combination of the methods, the participating insurance or

reinsurance undertaking, the insurance holding company or the mixed financial holding company should consider the amount of minority interests in the eligible own funds exceeding the contribution of the insurance or reinsurance subsidiary, insurance holding company or mixed financial holding company to the group solvency capital requirement as non-available for covering the group solvency capital requirement.

G.59. The calculation of the amount to be deducted from the eligible own funds for minority interests should be done in the following order:

1. calculate the eligible own funds exceeding the contribution of the subsidiary undertaking to the group solvency capital requirement,
2. deduct the non-available own funds from the eligible own funds calculated in point 1,
3. calculate the minority interest share from the result of point 2.

G.3. Deduction and aggregation method

G.60. This section details the application of the deduction and aggregation (D&A) method for calculating group solvency. Under this method, rather than applying the standard formula to the consolidated data, group solvency is assessed through the sum of the solo solvency capital requirements and own funds of the participating undertaking and of the proportional share of its related undertakings.

G.61. This should include non-EEA insurance undertakings as well as insurance holding companies and mixed financial holding companies.

G.62. When using the deduction and aggregation method for the inclusion of third country (re)insurance undertakings groups may use the local rules, as indicated in paragraph G.8. Participations in all other related entities outside the financial sector (both dominant and significant influence) should be included in accordance with V.8, paragraph 2 and the relevant equity risk charge as described on section SCR.5.43 in the solo SCR of the participating entity should be applied to ensure a consistent approach with the accounting consolidation method.

G.3.1. Aggregated group SCR

G.63. The aggregated group SCR is the sum of the following:

- the SCR of the participating insurance or reinsurance undertaking or the notional SCR of the insurance holding company or mixed financial holding company;
- the proportional share of the SCR of the related insurance or reinsurance undertakings or the proportional share of the notional SCR of the intermediate insurance holding company or mixed financial holding company;

- the proportional share of the capital requirements for credit institutions, investment firms, financial institutions, alternative investment fund managers, asset management companies and institutions for occupational retirement provision within the meaning of Directive 2003/41/EC, calculated according to the relevant sectoral rules and the proportional share of the notional solvency capital requirement of non-regulated undertakings carrying out financial activities; for related third country undertakings the capital requirement should be calculated according to relevant sectoral rules in the Community.

G.64. For the purpose of the Stress Test exercise, the proportional share of the relevant sectoral capital requirements for credit institutions, investment firms, financial institutions, alternative investment fund managers, asset management companies and institutions for occupational retirement provision within the meaning of Directive 2003/41/EC and the proportional share of the notional capital requirements of non-regulated undertakings carrying out financial activities should be deducted from the aggregated group SCR. If these capital requirements are non-material to the group they can be included for simplicity.

G.3.2. Aggregated group own funds

G.65. The aggregated group eligible own funds are the sum of the following:

- the own funds eligible for the SCR of the participating insurance or reinsurance undertaking, insurance holding company and mixed financial holding company;
- the proportional share of the participating insurance or reinsurance undertaking in the own funds eligible for the SCR of the related (re)insurance undertakings and intermediate insurance holding companies or mixed financial holding company;
- the proportional share of own funds of credit institutions, investment firms, financial institutions, alternative investment fund managers, asset management companies and institutions for occupational retirement provision within the meaning of Directive 2003/41/EC, calculated according to the relevant sectoral rules and the proportional share of own funds of non-regulated undertakings carrying out financial activities; for related third country undertakings own funds should be calculated according to relevant sectoral rules in the Union.

G.66. For the purpose of the Stress Test exercise, the proportional share of the own funds from credit institutions, investment firms, financial institutions, alternative investment fund managers, asset management companies and institutions for occupational retirement provision within the meaning of Directive 2003/41/EC and non-regulated undertakings carrying out financial activities should be deducted from the aggregated group own funds. If these capital requirements are non-material to the group they can be included for simplicity.

G.67. Own funds should be calculated net of any intra-group transactions and net of the adjustments related to non-available own funds.

DRAFT
